Preliminaries – Kiến thức chuẩn bị

Resources – Tài nguyên.

1. [WW16]. YONGHUI WU, JIANDE WANG. *Data Structure Practice for Collegiate Programming Contests & Education*.
2. [WW18]. YONGHUI WU, JIANDE WANG. *Algorithm Design Practice for Collegiate Programming Contests & Education*.
3. Codeforces <https://codeforces.com/>.
4. CSES Problem Sets. <https://cses.fi/problemset/>.

Some critical-thinking questions:

Question 1 (Generalization; main ideas of a solution/proof). *What are main ideas of a solution or a proof of a problem that can be used to generalize the original problem?*

Question 2 (Link¹). *Can we draw some link(s) between different problems? Even they are in different categories: algebra, analysis, & combinatorics.*

Remark 1 (Repeat & mathematical induction – Lặp & quy nạp toán học). *Nếu bài toán có chứa $n \in \mathbb{N}^*$ tổng quát hoặc chứa số tự nhiên của năm ra đề, e.g., 2025, thì đưa 2025 về $n \in \mathbb{N}^*$, rồi sử dụng các kỹ thuật toán học để đưa về phép lặp, hoặc sử dụng phương pháp quy nạp toán học (method mathematical induction).*

Notation – Ký hiệu

- $\overline{m, n} := \{m, m+1, \dots, n-1, n\}$, $\forall m, n \in \mathbb{Z}$, $m \leq n$. Hence the notation “for $i \in \overline{m, n}$ ” means “for $i = m, m+1, \dots, n$ ”, i.e., chỉ số/biến chạy i chạy từ $m \in \mathbb{Z}$ đến $n \in \mathbb{Z}$. Trong trường hợp $a, b \in \mathbb{R}$, ký hiệu $\overline{a, b} := [\overline{a}], [\overline{b}]$ có nghĩa như định nghĩa trước đó với $m := \lceil a \rceil$, $n := \lfloor b \rfloor \in \mathbb{Z}$; khi đó ký hiệu “for $i \in \overline{a, b}$ ” với $a, b \in \mathbb{R}$, $a \leq b$ có nghĩa là “for $i = \lceil a \rceil, \lceil a \rceil + 1, \dots, \lfloor b \rfloor - 1, \lfloor b \rfloor$, i.e., chỉ số/biến chạy i chạy từ $\lceil a \rceil$ đến $\lfloor b \rfloor \in \mathbb{Z}$.
- $\lfloor x \rfloor$, $\{x\}$ lần lượt được gọi là *phần nguyên & phần lẻ* (integer- & fractional parts) của $x \in \mathbb{R}$, see, e.g., [Wikipedia/floor & ceiling functions](#), [Wikipedia/fractional part](#).
- $x_+ := \max\{x, 0\}$, $x_- := \max\{-x, 0\} = -\min\{x, 0\}$ lần lượt được gọi là *phần dương & phần âm* (positive- & negative parts) của $x \in \mathbb{R}$.
- s.t.: abbreviation of ‘such that’.
- w.l.o.g.: abbreviation of ‘without loss of generality’.

Question 3 ($\text{MO} \mapsto \text{OI}$: Mathematical Olympiads \mapsto Olympiads of Informatics). *Những bài Olympic Toán học, e.g., VMO, USAMO, China MO, đặc biệt là IMO, IMO shortlists, etc. nào có thể code được? Đưa các tiêu chí cho việc code-able.*

Answer. Trước hết các bài toán Olympic có thể code được gồm các bài về mảng số (arrays of real numbers, or finite sequence of real numbers), dãy số (infinite sequences of of real numbers), hình học tính toán (computational geometry), hình học tổ hợp (combinatorial geometry), số học/lý thuyết số (number theory). Đối với từng bài, mới biết có thể ra bài Olympic Tin tương ứng hay không, & còn tùy thuộc vào trình độ của người chế đề.

Các bài hình học thiên về thuần chứng minh thường khó ra đề Olympic Tin tương ứng 1 cách trực tiếp được, trừ khi là AlphaGeometry. Prove me wrong. □

1.1 The art of handling inputs & formatting outputs – Nghệ thuật xử lý các dạng đầu vào & định dạng các dạng đầu ra

To handle various types of inputs & format various types of outputs, see, e.g.:

- [Peking University Judge Online for ACM/ICPC \(POJ\)/FAQ](#). See, e.g., [Laa20; Laa24, Chap. 2, Subsect. 2.1.1, pp. 10–11].

To compile a C++ program in Linux, run in Terminal:

```
$ g++ -O2 -Wall program_name.cpp -o program_name
$ ./program_name
```

or if you want to transfer input file into it & print output into Terminal screen:

```
$ ./program_name < program_name.inp
```

or if you want to transfer input file into it & print output into a file:

```
$ ./program_name < program_name.inp > program_name.out
```

1.2 Repeat/Loop – Lặp

1.3 String data – Kiểu dữ liệu chuỗi

1.4 Array data – Kiểu dữ liệu mảng

Về mặt toán học, kiểu dữ liệu mảng là dãy số hữu hạn $(a_i)_{i=1}^n = (a_1, a_2, \dots, a_n)$. Về mặt Tin học, kiểu dữ liệu mảng được ký hiệu bởi `a[1..n]`.

Bài toán 1 ([Đức22], 141., pp. 140–141: Count digit – Đếm chữ số). Cho dãy số n số nguyên dương $A[1..n]$ & 1 chữ số k . Đếm số lần xuất hiện chữ số k trong dãy A đã cho. E.g., với dãy $A[] = (11, 12, 13, 14, 15)$, thì chữ số $k = 1$ xuất hiện 6 lần trong dãy A .

Input. Dòng 1 của đầu vào chứa số nguyên $T \in \mathbb{N}^*$ cho biết số bộ dữ liệu cần kiểm tra. Mỗi bộ dữ liệu gồm: (i) Dòng đầu chứa lần lượt $n, k \in \mathbb{N}$ là số phần tử trong dãy $A[]$ & chữ số k . (ii) Dòng 2 chứa n số nguyên cách nhau 1 dấu cách, mô tả các phần tử của dãy A .

Output. Ứng với mỗi bộ dữ liệu, in ra 1 dòng chứa kết quả của bài toán tương ứng với bộ dữ liệu đầu vào đó.

Constraint. $1 \leq T \leq 100, 1 \leq n \leq 100, 0 \leq k \leq 9, 1 \leq A[i] \leq 1000, \forall i = 1, \dots, n$.

- Input: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/input/count_digit.inp.
- Output: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/output/count_digit.out.
- Python: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/Python/count_digit.py.
- C++: ?

Bài toán 2 ([Đức22], 141., pp. 140–141: Count digit – Đếm chữ số). Cho dãy số nguyên $a[1], a[2], \dots, a[n]$. Thực hiện nhiệm vụ: Chia dãy thành 2 phần trái & phải, trong đó phần trái gồm $\frac{n}{2}$ phần tử đầu tiên & phần phải gồm các phần tử còn lại. Tính tổng các phần tử của mỗi phần, cuối cùng tính & in ra tích 2 tổng tìm được.

Input. Dòng 1 của đầu vào chứa $t \in \mathbb{N}^*$ cho biết số bộ dữ liệu cần kiểm tra. Mỗi bộ dữ liệu gồm: (i) Dòng đầu chứa $n \in \mathbb{N}^*$ cho biết số phần tử của dãy. (ii) Dòng 2 chứa n số nguyên cách nhau bởi dấu cách, là các phần tử của dãy.

Output. Ứng với mỗi bộ dữ liệu, in ra 1 dòng chứa kết quả của bài toán tương ứng với bộ dữ liệu đầu vào đó.

Constraint. $1 \leq t \leq 100, 1 \leq n \leq 100, 1 \leq A[i] \leq 100, \forall i = 1, \dots, n$.

- Input: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/input/prod_left_right_sums.inp.
- Output: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/output/prod_left_right_sums.out.
- Python: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/Python/prod_left_right_sums.py.

```
t = int(input())
for _ in range(t):
    n = int(input())
    a = list(map(int, input().split()))
    lsum = rsum = 0
    for i in range(n//2):
        lsum += a[i]
    for i in range(n//2, n):
        rsum += a[i]
    print(lsum * rsum)
```

- C++: ?

1.4.1 Kỹ thuật mảng chỉ số cho kiểu dữ liệu mảng

A general idea. Giả sử có dãy số $\{a_n\}_{n=1}^n$ được lưu với mảng $\mathbf{a} = \mathbf{a}[0], \mathbf{a}[1], \dots, \mathbf{a}[\mathbf{n} - 1]$ với $a_i = \mathbf{a}[\mathbf{i} - 1], \forall i \in [n]$. Giả sử có $m \in \mathbb{N}^*$ mảng chỉ số $\{f_i\}_{i=1}^m$ mà mỗi mảng có số phần tử là 1 hàm của n , $f_i : [n] \rightarrow \mathbb{R}$, mà m mảng chỉ số này lại liên quan hay ràng buộc với nhau theo những cách nào đấy, biểu diễn được bằng công thức toán, e.g., $f_i(n) = F_i(f_1, f_2, \dots, f_{i-1}, f_{i+1}, \dots, f_n)$. Tìm hiểu cấu trúc toán học, cấu trúc giải thuật, & tạo ra các ví dụ để minh họa ý tưởng tổng quát này.

Kỹ thuật *sliding window* cũng là 1 trường hợp riêng của ý tưởng này với $m = 2$, $f_1(i) = \text{left index}$ (chỉ số trái), $f_2(i) = \text{right index}$ (chỉ số phải) & ta thường lấy tổng $\sum_{\text{left_index}}^{\text{right_index}} a[i]$, tích $\prod_{\text{left_index}}^{\text{right_index}} a[i]$, hoặc 1 hàm nào đấy của các phần tử bị giới hạn bởi 2 chỉ số trái & phải này, e.g., $\sum_{\text{left_index}}^{\text{right_index}} f(a[i])$ or $F(a[\text{left_index}], \dots, a[\text{right_index}])$.

Problem 1 (Techniques of additional arrays – Kỹ thuật mảng bổ sung, R+4). *Establish the general & rigorous frameworks for the idea of using additional arrays to micro manage or to get insights of a given array in some higher levels.*

– Thiết lập khuôn khổ chung & chặt chẽ cho ý tưởng sử dụng các mảng bổ sung để quản lý vi mô hoặc để có được thông tin chi tiết về 1 mảng nhất định ở 1 số cấp độ cao hơn.

Chương 2

Introductory Problems – Các Bài Toán Mở Đầu

Problem 2 (CSES Problem Set/weird algorithm). Consider an algorithm that takes as input a positive integer n . If n is even, the algorithm divides it by 2, & if n is odd, the algorithm multiplies it by 3 & adds 1. The algorithm repeats this, until $n = 1$. E.g., the sequence for $n = 3$ is as follows: $3 \rightarrow 10 \rightarrow 5 \rightarrow 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1$. Simulate the execution of the algorithm for a given value of n .

Input. The only input line contains an integer $n \in \mathbb{N}^*$.

Output. Print a line that contains all values of n during the algorithm.

Constraints. $n \in [10^6]$.

Sample.

weird_algorithm.inp	weird_algorithm.out
3	3 10 5 16 8 4 2 1

Problem 3 (CSES Problem Set/missing number). You are given all numbers in $[n]$ except one. Find the missing number.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$. The 2nd line contains $n - 1$ numbers. Each number is distinct & between 1 & n (inclusive) .

Output. Print the missing number.

Constraints. $n \leq 2 \cdot 10^5$.

Sample.

missing_number.inp	missing_number.out
5 2 3 1 5	4

Problem 4 (CSES Problem Set/repetitions). You are given a DNA sequence: a string consisting of characters A, C, G, T. Find the longest repetition in the sequence. This is a maximum-length substring containing only 1 type of character.

Input. The only input line contains a string of $n \in \mathbb{N}^*$ characters.

Output. Print 1 integer: the length of the longest repetition.

Constraints. $n \in [10^6]$.

Sample.

repetition.inp	repetition.out
ATTCTGCGGA	3

Problem 5 (CSES Problem Set/increasing array). You are given an array of $n \in \mathbb{N}^*$ integers. You want to modify the array so that it is increasing, i.e., every element is at least as large as the previous element. On each move, you may increase the value of any element by 1. What is the minimum number of moves required?

Input. The 1st input line contains an integer $n \in \mathbb{N}^*$: the size of the array. Then, the 2nd line contains n integers $x_1, x_2, \dots, x_n \in \mathbb{N}^*$: the contents of the array.

Output. Print the minimum number of moves.

Constraints. $n \in [2 \cdot 10^5], x_i \in [10^9], \forall i \in [n]$.

Sample.

increasing_array.inp	increasing_array.out
5 3 2 5 1 7	5

Problem 6 (CSES Problem Set/permutations). A permutation of $[n]$ is called beautiful if there are no adjacent elements whose difference is 1. Given n , construct a beautiful permutation if such a permutation exists.

Input. The 1st input line contains an integers $n \in \mathbb{N}^*$.

Output. Print a beautiful permutation of integers $1, 2, \dots, n$. If there are several solutions, you may print any of them. If there are no solutions, print NO SOLUTION.

Constraints. $n \in [10^6]$.

Sample.

permutation.inp	permutation.out
5	4 2 5 3 1
3	NO SOLUTION

Problem 7 (CSES Problem Set/number spiral). A number spiral is an infinite grid whose upper-left square has number 1. Here are the 1st 5 layers of the spiral

1	2	9	10	25
4	3	8	11	24
5	6	7	12	23
16	15	14	13	22
17	18	19	20	21

Find out the number is row y & column x .

Input. The 1st input line contains an integer $t \in \mathbb{N}^*$: the number of tests. After this, there are t lines, each containing integers $y, z \in \mathbb{N}^*$.

Output. For each test, print the number in row y & column x .

Constraints. $t \in [10^5], x, y \in [10^9]$.

Sample.

number_spiral.inp	number_spiral.out
3	8
2 3	1
1 1	15
4 2	

Problem 8 (CSES Problem Set/two knights). Count for $k \in [n]$ the number of ways 2 knights can be placed on a $k \times k$ chessboard so that they do not attack each other.

Input. The only input line contains an integer $n \in \mathbb{N}^*$.

Output. Print n integers: the results.

Constraints. $n \in [10^4]$.

Sample.

two_knight.inp	two_knight.out
8	0 6 28 96 252 550 1056 1848

Problem 9 (CSES Problem Set/two sets). Divide the numbers $[n]$ into 2 sets of equal sum.

Input. The only input line contains an integer $n \in \mathbb{N}^*$.

Output. Print YES, if the division is possible, & NO otherwise. After this, if the division is possible, print an example of how to create the sets. 1st, print the number of elements in the 1st set followed by the elements themselves in a separate line, & then, print the 2nd set in a similar way.

Constraints. $n \in [10^6]$.

Sample.

two_set.inp	two_set.out
7	YES 4 1 2 4 7 3 3 5 6
6	NO

Problem 10 (CSES Problem Set/bit strings). Calculate the number of bit strings of length $n \in \mathbb{N}^*$, e.g., if $n = 3$, the correct answer is 8, because the possible bit strings are 000, 001, 010, 011, 100, 101, 110, 111.

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print the result modulo $10^9 + 7$.

Constraints. $n \in [10^6]$.

Sample.

bit_string.inp	bit_string.out
3	8

Solution. The number of bit strings of length $n \in \mathbb{N}^*$ is 2^n . □

Problem 11 (CSES Problem Set/trailing zeros). Calculate the number of trailing zeros in the factorial $n!$, e.g., $20! = 2432902008176640000$ & it has 4 trailing zeros.

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print the number of trailing zeros is $n!$.

Constraints. $n \in [10^6]$.

Sample.

trailing_zero.inp	trailing_zero.out
20	4

Problem 12 (CSES Problem Set/coin piles). You have 2 coin piles containing $a, b \in \mathbb{N}$ coins. On each move, you can either remove 1 coin from the left pile & 2 coins from the right pile, or 2 coins from the left pile & 1 coin from the right pile. Efficiently find out if you can empty both the piles.

Input. The 1st input line has an integer t integers $n, m \in \mathbb{N}^*$: the number of tests. After this, there are t lines, each of which has 2 integers $a, b \in \mathbb{N}$: the numbers of coins in the piles.

Output. For each test, print YES if you can empty the piles & NO otherwise.

Constraints. $t \in [10^5]$, $a, b \in \overline{0, 10^9}$.

Sample.

coin_pile.inp	coin_pile.out
3	YES
2 1	NO
2 2	YES
3 3	

Problem 13 (CSES Problem Set/palindrome reorder). Given a string, recorder its letters in such a way that it becomes a palindrome (i.e., it reads the same forwards & backwards).

Input. The only input line has a string of length $n \in \mathbb{N}^*$ consisting of characters A-Z.

Output. Print a palindrome consisting of the characters of the original string. You may print any valid solution. If there are no solutions, print NO SOLUTION.

Constraints. $n \in [10^6]$.

Sample.

palindrome_reorder.inp	palindrome_reorder.out
AAAACACBA	AACABACAA

Problem 14 (CSES Problem Set/gray code). A Gray code (not Gay code) is a list of all 2^n bit strings of length $n \in \mathbb{N}^*$, where any 2 successive strings differ in exactly 1 bit (i.e., their Hamming distance is 1). Create a Gray code for a given length n .

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print 2^n lines that describe the Gray code. You can print any valid solution.

Constraints. $n \in [16]$.

Sample.

gray_code.inp	gray_code.out
2	00
	01
	11
	10

Problem 15 (CSES Problem Set/tower of Hanoi). The Tower of Hanoi game consists of 3 stacks (left, middle, & right) & $n \in \mathbb{N}^*$ round disks of different sizes. Initially, the left stack has all the disks, in increasing order of size from top to bottom. The goal is to move all the disks to the right stack using the middle stack. On each move you can move the uppermost disk from a stack to another stack. In addition, it is not allowed to place a larger disk on a smaller disk. Find a solution that minimizes the number of moves.

Input. The only input line has an integer $n \in \mathbb{N}^*$: the number of disks.

Output. 1st print an integer $k \in \mathbb{N}^*$: the minimum number of moves. After this, print k lines that describe the moves. Each line has 2 integers $a, b \in [3]$: you move a disk from stack a to stack b .

Constraints. $n \in [16]$.

Sample.

tower_Hanoi.inp	tower_Hanoi.out
2	3
	1 2
	1 3
	2 3

Problem 16 (CSES Problem Set/creating strings). Given a string, generate all different strings that can be created using its characters.

Input. The only input line has a string of length $n \in \mathbb{N}^*$. Each character is between a-z.

Output. 1st print an integer k : the number of strings. Then print k lines: the strings in alphabetical order.

Constraints. $n \in [8]$.

Sample.

creating_string.inp	creating_string.out
aabac	20 aaabc aaacb aabac aabca aacab aacba abaac abaca abcaa acaab acaba acbaa baaac baaca bacaa bcaaa caaab caaba cabaa cbaaa

Problem 17 (CSES Problem Set/apple division). There are $n \in \mathbb{N}^*$ apples with known weights. Divide the apples into 2 groups so that the difference between the weights of the groups is minimal.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of apples. The next line has n integers p_1, p_2, \dots, p_n : the weight of each apple.

Output. Print 1 integer: the minimum difference between the weights of the groups.

Constraints. $n \in [20], p_i \in [10^9]$.

Sample.

apple_division.inp	apple_division.out
5 3 2 7 4 1	1

Explanation. Group 1 has weights 2, 3, 4 (total weight 9), & group 2 has weights 1, 7 (total weight 8).

Problem 18 (CSES Problem Set/chessboard & queens). Place 8 queens on a chessboard so that no 2 queens are attacking each other. As an additional challenge, each square is either free or reserved, & you can only place queens on the free squares. However, the reserved squares do not prevent queens from attacking each other. Count the number of possible ways are there to place the queens.

Input. The input line has 8 lines, & each of them has 8 characters. Each square is either free . or reversed *.

Output. Print 1 integer: the number of ways you can place the queens.

Constraints. $n \in [10^5], m \in [100], x_i \in \{0, 1, \dots, m\}$.

Sample.

chessboard_queen.inp	chessboard_queen.out
.....*.....**.*	65

Problem 19 (CSES Problem Set/Raab game I). Consider a 2 play game where each player has $n \in \mathbb{N}^*$ cards numbered $1, 2, \dots, n$. On each turn both players place 1 of their cards on the table. The player who placed the higher card gets 1 point. If the cards are equal, neither player gets a point. The game continues until all cards have been played. You are given the number of cards n & the players's scores at the end of the game, $a, b \in \mathbb{N}$. Give an example of how the game could have played out.

Input. The 1st input line contains 1 integer $t \in \mathbb{N}^*$: the number of tests. Then there are t lines, each with 3 integers $n, a, b \in \mathbb{N}^*$.

Output. For each test case print YES if there is a game with the given outcome & NO otherwise. If the answer is YES, print an example of 1 possible game. Print 2 line representing the order in which the players place their cards. You can give any valid example.

Constraints. $t \in [10^3], n \in [100], a, b \in \overline{0, n}$.

Sample.

Raab_game I.inp	Raab_game I.out
5	YES
4 1 2	1 4 3 2

	1 2 3
	YES
	1 2
	2 1
	NO

Problem 20 (CSES Problem Set/mex grid construction). Construct an $n \times n$ grid where each square has the smallest nonnegative integer that does not appear to the left on the same row or above on the same column.

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print the grid according to the example.

Constraints. $n \in [100]$.

Sample.

mex_grid_construction.inp	mex_grid_construction.out
5	0 1 2 3 4 1 0 3 2 5 2 3 0 1 6 3 2 1 0 7 4 5 6 7 0

Problem 21 (CSES Problem Set/knight moves grid). There is a knight on a $n \times n$ chessboard. For each square, print the minimum number of moves the knight needs to do to reach the top-left corner.

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print the minimum number of moves for each square.

Constraints. $n \in \overline{4, 10^3}$.

Sample.

knight_move_grid.inp	knight_move_grid.out

Problem 22 (CSES Problem Set/grid coloring I). You are given an $n \times m$ grid where each cell contains 1 character A, B, C or D. For each cell, you must change the character to A, B, C or D. The new character must be different from the old one. Change the characters in every cell s.t. no 2 adjacent cells have the same character.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of rows & columns. The next n lines each have m characters: the description of the grid.

Output. Print n lines each with m characters: the description of the final grid. You may print any valid solution. If no solution exists, just print IMPOSSIBLE.

Constraints. $m, n \in [500]$.

Sample.

grid_coloring_I.inp	grid_coloring_I.out
3 4 AAAA BBBB CCDD	CDCD DCDC ABAB

Problem 23 (CSES Problem Set/digit queries). Consider an infinite string that consists of all positive integers in increasing order: 12345678910111213141516171819202122232425... Process $q \in \mathbb{N}^*$ queries of the form: what is the digit at position $k \in \mathbb{N}^*$ in the string?

Input. The 1st input line has an integer $q \in \mathbb{N}^*$: the number of queries. After this, there are q lines that describe the queries. Each line has an integer k : a 1-indexed position in the string.

Output. For each query, print the corresponding digit.

Constraints. $q \in [10^3], k \in [10^{18}]$.

Sample.

digit_query.inp	digit_query.out
3	7
7	4

Chương 3

Array & Sequence: Mảng & Dãy

Problem 26 (IMO2007P1). Real numbers a_1, a_2, \dots, a_n are given. For each $i \in [n]$ define

$$d_i := \max_{j \in [i]} a_j - \min_{j \in [i, n]} a_j = \max_{1 \leq j \leq i} a_j - \min_{i \leq j \leq n} a_j, \quad d = \max_{i \in [n]} d_i.$$

(a) Prove that, for any real numbers $x_1 \leq x_2 \leq \dots \leq x_n$,

$$\max_{i \in [n]} |x_i - a_i| \geq \frac{d}{2}.$$

(b) Show that there are real numbers $x_1 \leq x_2 \leq \dots \leq x_n$ s.t. equality holds.

Bài toán 3 ([VL24], 1., p. 10, IMO2007P1). Cho trước n số thực a_1, a_2, \dots, a_n . Với mỗi $i \in [n]$, đặt

$$d_i := \max_{j \in [i]} a_j - \min_{j \in [i, n]} a_j = \max_{1 \leq j \leq i} a_j - \min_{i \leq j \leq n} a_j, \quad d = \max_{i \in [n]} d_i.$$

(a) Chứng minh: với n số thực $x_1 \leq x_2 \leq \dots \leq x_n$ tùy ý,

$$\max_{i \in [n]} |x_i - a_i| \geq \frac{d}{2}.$$

(b) Chỉ ra tồn tại n số thực $x_1 \leq x_2 \leq \dots \leq x_n$ sao cho bất đẳng thức cuối trở thành đẳng thức.

Problem 27. Let $n \in \mathbb{N}^*$ & let $a_1, \dots, a_k \in [n]$, $k \geq 2$ s.t. $n | a_i(a_{i+1} - 1)$, $\forall i \in [k-1]$. Prove that $n \nmid a_k(a_1 - 1)$.

Bài toán 4 ([VL24], 1., p. 14, IMO2009P1). Cho $n \in \mathbb{N}^*$, xét $a_1, \dots, a_k \in [n]$ là $k \in \mathbb{N}, k \geq 2$ số nguyên khác nhau sao cho $a_i(a_{i+1} - 1) : n$, $\forall i \in [k-1]$. Chứng minh $a_k(a_1 - 1) \nmid n$.

Bài toán 5 (CP version of IMO2009P1). Cho $n \in \mathbb{N}^*$ được nhập vào. Đếm số tất cả các trường hợp có thể của dãy số $a_1, \dots, a_k \in [n]$ là $k \in \mathbb{N}, k \geq 2$ số nguyên khác nhau sao cho $a_i(a_{i+1} - 1) : n$, $\forall i \in [k-1]$, & xét tính chia hết của $a_k(a_1 - 1)$ cho n . (a) Sử dụng duyệt vét cạn thông thường. (b) Sử dụng phân tích thừa số nguyên tố.

Problem 28 (IMO2009P3). Suppose that $\{s_n\}_{n=1}^\infty$ is a strictly increasing sequence of positive integers s.t. the subsequences $\{s_{s_n}\}_{n=1}^\infty, \{s_{s_n+1}\}_{n=1}^\infty$ are both arithmetic progressions. Prove that the sequence $\{s_n\}_{n=1}^\infty$ is itself an arithmetic progression.

Bài toán 6 ([VL24], 1., p. 14, IMO2009P3). Cho biết $\{s_n\}_{n=1}^\infty$ là dãy tăng thực sự gồm các số nguyên dương sao cho 2 dãy con $\{s_{s_n}\}_{n=1}^\infty, \{s_{s_n+1}\}_{n=1}^\infty$ đều tạo thành 2 cấp số cộng. Chứng minh dãy $\{s_n\}_{n=1}^\infty$ cũng là cấp số cộng.

Bài toán 7 (CP version of IMO2009P3). (a) Minh họa cho bài toán IMO2009P3, e.g., khởi tạo $\{s_n\}_{n=1}^\infty = \{n\}_{n=1}^\infty$, rồi điều chỉnh bằng cách tăng giảm các số hạng s_n để 2 dãy con $\{s_{s_n}\}_{n=1}^\infty, \{s_{s_n+1}\}_{n=1}^\infty$ đều tạo thành 2 cấp số cộng, sau đó kiểm tra dãy ban đầu có phải là cấp số cộng không. (b) Bài toán có mở rộng ra cho cấp số nhân được không?

Problem 29 (IMO2010P6). Let $\{a_n\}_{n=1}^\infty \subset (0, \infty)$ be a sequence of positive real numbers. Suppose that for some positive integer s , we have $a_n = \max\{a_i + a_{n-i}; 1 \leq i \leq n-1\}$, $\forall n > s$. Prove that there exist $l \in [s], N \in \mathbb{N}^*$ s.t. $a_n = a_l + a_{n-l}$, $\forall n \geq N$.

Bài toán 8 ([VL24], 6., p. 16, IMO2010P6). Giả sử $\{a_n\}_{n=1}^\infty \subset (0, \infty)$ là 1 dãy số thực dương. Giả sử với số nguyên dương s cố định nào đó, ta có $a_n = \max\{a_i + a_{n-i}; 1 \leq i \leq n-1\}$, $\forall n > s$. Chứng minh tồn tại $l \in [s], N \in \mathbb{N}^*$ sao cho $a_n = a_l + a_{n-l}$, $\forall n \geq N$.

Bài toán 9 (CP version of IMO2010P6). Viết thuật toán & chương trình C/C++, Pascal, Python để minh họa IMO2010P6.

Chương 4

Sorting & Searching – Sắp Xếp & Tìm Kiếm

Problem 30 (CSES Problem Set/distinct numbers). You are given a list of $n \in \mathbb{N}^*$ integers. Calculate the number of distinct values in the list.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of values. The 2nd line has n integers $x_1, x_2, \dots, x_n \in \mathbb{Z}$.

Output. Print 1 integer: the

Constraints. $n \in [2 \cdot 10^5], m \in [100], x_i \in [10^9]$.

Sample.

distinct_number.inp	distinct_number.out
5 2 3 2 2 3	2

Problem 31 (CSES Problem Set/apartments). There are $n \in \mathbb{N}^*$ applicants & $m \in \mathbb{N}^*$ free apartments. Distribute the apartments so that as many applicants as possible will get an apartment. Each applicant has a desired apartment size, & they will accept any apartment whose size is close enough to the desired size.

Input. The 1st input line has 3 integers $n, m, k \in \mathbb{N}^*$: the number of applicants, the number of apartments, & the maximum allowed difference. The next line contains n integers a_1, a_2, \dots, a_n : the desired apartment size of each applicant. If the desired size of an applicant is x , they will accept any apartment whose size is between $x - k$ & $x + k$. The last line contains m integers b_1, b_2, \dots, b_m : the size of each apartment.

Output. Print 1 integer: the number of applicants who will get an apartment.

Constraints. $m, n \in [2 \cdot 10^5], k \in [0, 10^9], a_i, b_j \in [10^9], \forall i \in [n], \forall j \in [m]$.

Sample.

4 3 5 60 45 80 60 30 60 75	2

Problem 32 (CSES Problem Set/Ferris wheel). There are $n \in \mathbb{N}^*$ children who want to go to a Ferris wheel. Find a gondola for each child. Each gondola may have 1 or 2 children on it, & in addition, the total weight in a gondola may not exceed x . You know the weight of every child. What is the minimum number of gondolas needed for the children?

Input. The 1st input line contains 2 integers $n, x \in \mathbb{N}^*$: the number of children & the maximum allowed weight. The next line contains n integers p_1, p_2, \dots, p_n : the weight of each child.

Output. Print 1 integer: the minimum number of gondolas.

Constraints. $n \in [2 \cdot 10^5], m \in [100], x \in [10^9], p_i \in [x], \forall i \in [n]$.

Sample.

Problem 33 (CSES Problem Set/concert tickets). There are $n \in \mathbb{N}^*$ concert tickets available, each with a certain price. Then, $m \in \mathbb{N}^*$ customers arrive, one after another. Each customer announces the maximum price they are willing to pay for a ticket, & after this, they will get a ticket with the nearest possible price s.t. it does not exceed the maximum price.

Input. The 1st input line contains 2 integers $n, m \in \mathbb{N}^*$: the number of tickets & the number of customers. The next line contains n integers h_1, h_2, \dots, h_n : the price of each ticket. The last line contains m integers t_1, t_2, \dots, t_m : the maximum price for each customer in the order they arrive.

Output. Print, for each customer, the price that they will pay for their ticket. After this, the ticket cannot be purchased again. If a customer cannot get any ticket, print -1.

Constraints. $m, n \in [2 \cdot 10^5], h_i, t_j \in [10^9], \forall i \in [n], \forall j \in [m]$.

Sample.

Problem 39 (CSES Problem Set/missing coin sum). You have $n \in \mathbb{N}^*$ coins with positive integer values. What is the smallest sum you cannot create using a subset of the coins?

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of coins. the 2nd line has n integers x_1, x_2, \dots, x_n : the value of each coin.

Output. Print 1 integer: the smallest coin sum.

Constraints. $n \in [2 \cdot 10^5], x_i \in [10^9], \forall i \in [n]$.

Sample.

missing_coin_sum.inp	missing_coin_sum.out
5 2 9 1 2 7	6

Problem 40 (CSES Problem Set/collecting numbers). You are given an array that contains each number $\in [n]$ exactly once. Collect the numbers from 1 to n in increasing order. On each round, you go through the array from left to right & collect as many numbers as possible. What will be the total number of rounds?

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the array size. The next line has n integers x_1, x_2, \dots, x_n : the numbers in the array.

Output. Print 1 integer: the number of rounds.

Constraints. $n \in [2 \cdot 10^5], m \in [100], x_i \in \{0, 1, \dots, m\}$.

Sample.

collecting_number.inp	collecting_number.out
5 4 2 1 5 3	3

Problem 41 (CSES Problem Set/collecting numbers II). You are given an array that contains each number $\in [n]$ exactly once. Collect the numbers from 1 to n in increasing order. On each round, you go through the array from left to right & collect as many numbers as possible. Giving $m \in \mathbb{N}^*$ operations that swap 2 numbers in the array, report the number of rounds after each operation.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the array size & the number of operations. The next line has n integers x_1, x_2, \dots, x_n : the numbers in the array. Finally, there are m lines that describe the operations. Each line has 2 integers $a, b \in \mathbb{N}^*$: the numbers at positions a, b are swapped.

Output. Print m integers: the number of rounds after each swap.

Constraints. $m, n \in [2 \cdot 10^5]$, $a, b \in [n]$.

Sample.

collecting_number_II.inp	collecting_number_II.out
5 3 4 2 1 5 3 2 3 1 5 2 3	2 3 4

Problem 42 (CSES Problem Set/playlist). You are given a playlist of a radio station since its establishment. The playlist has a total of $n \in \mathbb{N}^*$ songs. What is the longest sequence of successive songs where each song is unique?

Input. The 1st input line contains an integer $n \in \mathbb{N}^*$: the number of songs. The next line has n integers k_1, k_2, \dots, k_n : the id number of each song.

Output. Print the length of the longest sequence of unique songs.

Constraints. $n \in [2 \cdot 10^5]$, $m \in [100]$, $k_i \in [10^9]$, $\forall i \in [n]$.

Sample.

playlist.inp	playlist.out
8 1 2 1 3 2 7 4 2	5

Problem 43 (CSES Problem Set/towers). You are given $n \in \mathbb{N}^*$ cubes in a certain order. Build towers using them. Whenever 2 cubes are 1 on top of the other, the upper cube must be smaller than the lower cube. You must process the cubes in the given order. You can always either place the cube on top of an existing tower, or begin a new tower. What is the minimum possible number of towers?

Input. The 1st input line contains an integer $n \in \mathbb{N}^*$: the number of cubes. The next line contains n integers k_1, k_2, \dots, k_n : the sizes of the cubes.

Output. Print 1 integer: the minimum number of towers.

Constraints. $n \in [2 \cdot 10^5]$, $k_i \in [10^9]$.

Sample.

tower.inp	tower.out
5 3 8 2 1 5	2

Problem 44 (CSES Problem Set/traffic lights). There is a street of length x whose positions are numbered $0, 1, \dots, x$. Initially there are no traffic lights, but $n \in \mathbb{N}^*$ sets of traffic lights are added to the street one after another. Calculate the length of the longest passage without traffic lights after each addition.

Input. The 1st input line has 2 integers $x, n \in \mathbb{N}^*$: the length of the street & the number of sets of traffic lights. Then, the next line contains n integers p_1, p_2, \dots, p_n : the position of each set of traffic lights. Each position is distinct.

Output. Print the length of the longest passage without traffic lights after each addition.

Constraints. $x \in [10^9], n \in [2 \cdot 10^5], p_i \in [x - 1], \forall i \in [n]$.

Sample.

Problem 48 (CSES Problem Set/Josephus problem II). Consider a game where there are $n \in \mathbb{N}^*$ children (numbered $1, 2, \dots, n$) in a circle. During the game, repeatedly $k \in \mathbb{N}^*$ children are skipped & 1 child is removed from the circle. In which order will the children be removed?

Input. The only input line has 2 integers $n, k \in \mathbb{N}^*$.

Output. Print n integers: the removal order.

Constraints. $n \in [2 \cdot 10^5], k \in \overline{0, 10^9}$.

Sample.

Problem 49 (CSES Problem Set/nested ranges check). Given $n \in \mathbb{N}^*$ ranges, determine for each range if it contains some other range & if some other range contains it. Range $[a, b]$ contains range $[c, d]$ if $a \leq c$ & $d \leq b$.

Input. The 1st input line has an integer $n, m \in \mathbb{N}^*$: the number of ranges. After this, there are n lines that describe the ranges. Each line has 2 integers $x, y \in \mathbb{Z}$: the range is $[x, y]$. You may assume that no range appears more than once in the input.

Output. 1st print a line that describes for each range (in the input order) if it contains some other range 1 or not 0. Then print a line that describes for each range (in the input order) if some other range contains it 1 or not 0.

Constraints. $n \in [2 \cdot 10^5], 1 \leq x < y \leq 10^9$.

Problem 51 (CSES Problem Set/room allocation). There is a large hotel, & $n \in \mathbb{N}^*$ customers will arrive soon. Each customer wants to have a single room. You know each customer's arrival & departure day. 2 customers can stay in the same room if the departure day of the 1st customer is earlier than the arrival day of the 2nd customer. What is the minimum number of rooms that are needed to accommodate all customers? & how can the rooms be allocated?

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of customers. Then there are n lines, each of which describes 1 customer. Each line has 2 integers $a, b \in \mathbb{N}^*$: the arrival & departure day.

Output. 1st print an integer k : the minimum number of rooms required. After that, print a line that contains the room number of each customer in the same order in the input. The rooms are numbered $1, 2, \dots, k$. You can print any valid solution.

Constraints. $n \in [2 \cdot 10^5], 1 \leq a \leq b \leq 10^9$.

Problem 52 (CSES Problem Set/factory machines). A factory has $n \in \mathbb{N}^*$ machines which can be used to make products. Make a total of $t \in \mathbb{N}^*$ products. For each machine, you know the number of seconds it needs to make a single product. The machines can work simultaneously, & you can freely decide their schedule. What is the shortest time needed to make t products?

Input. The 1st input line has 2 integers $n, t \in \mathbb{N}^*$: the number of machines & products. The next line has n integers k_1, k_2, \dots, k_n : the time needed to make a product using each machine.

Output. Print 1 integer: the minimum time needed to make t products.

Constraints. $n \in [2 \cdot 10^5], t, k_i \in [10^9], \forall i \in [n]$.

Sample.

factory_machine.inp	factory_machine.out

Explanation. Machine 1 makes 2 products, machine 2 makes 4 products & machine 3 makes 1 product.

Problem 53 (CSES Problem Set/tasks & deadlines). You have to process $n \in \mathbb{N}^*$ tasks. Each task has a duration & a deadline, & you will process the tasks in some order one after another. Your reward for a task is $d - f$ where d is its deadline & f is your finishing time. (The starting time is 0, & you have to process all tasks even if a task would yield negative reward.) What is your maximum reward if you act optimally?

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of tasks. After this, there are n lines that describe the tasks. Each line has 2 integers $a, d \in \mathbb{N}^*$: the duration & deadline of the task.

Output. Print 1 integer: the maximum reward.

Constraints. $n \in [2 \cdot 10^5], a, d \in [10^6]$.

Sample.

Problem 61 (CSES Problem Set/distinct values subarrays II). Given an array of $n \in \mathbb{N}^*$ integers. Calculate the number of subarrays that have at most k distinct values.

Input. The 1st input line has 2 integers $n, k \in \mathbb{N}^*$. The next line has n integers x_1, x_2, \dots, x_n : the contents of the array.

Output. Print 1 integer: the number of subarrays.

Constraints. $1 \leq k \leq n \leq 2 \cdot 10^5, x_i \in [10^9], \forall i \in [n]$.

Sample.

distinct_values_subarray_II.inp	distinct_values_subarray_II.out
5 2 1 2 3 1 1	10

Problem 62 (CSES Problem Set/array division). You are given an array containing $n \in \mathbb{N}^*$ positive integers. Divide the array into $k \in \mathbb{N}^*$ subarrays so that the maximum sum in a subarray is as small as possible.

Input. The 1st input line has 2 integers $n, k \in \mathbb{N}^*$: the size of the array & the number of subarrays in the division. The next line contains n integers x_1, x_2, \dots, x_n : the contents of the array.

Output. Print 1 integer: the maximum sum in a subarray in the optimal division.

Constraints. $n \in [2 \cdot 10^5], k \in [n], x_i \in [10^9]$.

Sample.

array_division.inp	array_division.out
5 3 2 4 7 3 5	8

Explanation. An optimal division is $[2, 4], [7], [3, 5]$ where the sums of the subarrays are 6, 7, 8. The largest sum is the last sum 8.

Problem 63 (CSES Problem Set/movie festival II). In a movie festival, $n \in \mathbb{N}^*$ movies will be shown. Sjrjälä's movie club consists of $k \in \mathbb{N}^*$ members, who will be all attending the festival. You know the starting & ending time of each movie. What is the maximum total number of movies the club members can watch entirely if they act optimally?

Input. The 1st input line has 2 integers $n, k \in \mathbb{N}^*$: the number of movies & club members. After this, there are n lines that describe the movies. Each line has 2 integers $a, b \in \mathbb{B}$: the starting & ending time of a movie.

Output. Print 1 integer: the maximum total number of movies.

Constraints. $1 \leq k \leq n \leq 2 \cdot 10^5, 1 \leq a < b \leq 10^9$.

Sample.

Problem 65 ([WW16], p. 4: financial management). LARRY graduated this year & finally has a job. He's making a lot of money, but somehow never seems to have enough. LARRY has decided that he needs to get a hold of his financial portfolio & solve his financial problems. The 1st step is to figure out what's been going on with his money. LARRY has his bank account statements & wants to see how much money he has. Help LARRY by writing a program to take his closing balance from each of the past 12 months & calculate his average account balance.

Input. The input will be 12 lines. Each line will contain the closing balance of his bank account for a particular month. Each number will be positive & displayed to the penny. No dollar sign will be included.

Output. The output will be a single number, the average (mean) of the closing balances for the 12 months. It will be rounded to the nearest penny, preceded immediately by a dollar sign, & followed by the end of the line. There will be no other spaces or characters in the output.

Math Analysis. Let $\{a_i\}_{i=1}^{12} \subset [0, \infty)$ be monthly incomes of 12 months. Compute their average by the formula $\bar{a} = \frac{1}{12} \sum_{i=1}^{12} a_i$. This can be generalized to $n \in \mathbb{N}^*$ months with a sequence of monthly incomes $\{a_i\}_{i=1}^n \subset [0, \infty)$ with its average value given by the formula $\bar{a} := \frac{1}{n} \sum_{i=1}^n a_i$.

CS Analysis. The income of 12 months `a[0..11]` is input by a `for` statement & the total income `sum := $\sum_{i=0}^{11} a[i]$` is calculated. Then the average monthly income `avg = sum/12` is calculated. Finally, `avg` is output in accordance with the problem's output format by utilizing `printf`'s format functionalities via `printf("$%.2f", avg)`.

- Input: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/input/financial_management.inp.
- Output: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/output/financial_management.out.
- C++: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/C++/financial_management.cpp.

```
#include <iostream>
using namespace std;
int main() {
    double avg, sum = 0.0, a[12] = {0};
    for (int i = 0; i < 12; ++i) { // input income of 12 months a[0..11] & summation
        cin >> a[i];
        sum += a[i];
    }
    avg = sum/12; // compute average monthly
    printf("$%.2f", avg); // output average monthly
    return 0;
}
```

Remark 2 (array of 0s). *The technique `a[12] = {0}` initializes an array `a` with all zero elements.*

Problem 66 ([WW16], pp. 5–6: doubles). *As part of an arithmetic competency program, your students will be given randomly generated lists of 2–15 unique positive integers & asked to determine how many items in each list are twice some other item in same list. You will need a program to help you with the grading. This program should be able to scan the lists & output the correct answer for each one. E.g., given the list 1 4 3 2 9 7 18 22 your program should answer 3, as 2 is twice 1, 4 is twice 2, & 18 is twice 9.*

Input. *The input file will consist of 1 or more lists of numbers. There will be 1 list of numbers per line. Each list will contain from 2–15 unique positive integers. No integer will be > 99. Each line will be terminated with the integer 0, which is not considered part of the list. A line with the single number –1 will mark the end of the file. Some lists may not contain any doubles.*

Output. *The output will consist of 1 line per input list, containing a count of the items that are double some other item.*

Bài toán có thể mở rộng từ double thành triple, multiple, or just equal.

Problem 67 ([WW16], pp. 7–8: sum of consecutive prime numbers). *Some positive integers can be represented by a sum of 1 or more consecutive prime numbers. How many such representations does a give positive integer have? E.g., the integer 53 has 2 representations $5 + 7 + 11 + 13 + 17$ & 53. The integer 41 has 3 representations: $2 + 3 + 5 + 7 + 11 + 13$, $11 + 13 + 17$, & 41. The integer 3 has only 1 representation, which is 3. The integer 20 has no such representations. Note: summands must be consecutive prime numbers, so neither $7 + 13$ nor $3 + 5 + 5 + 7$ is a valid representation for the integer 20. Your mission is to write a program that reports the number of representations for the given positive integer.*

Input. *The input is a sequence of positive integers, each in a separate line. The integers are between 2 & 10000, inclusive. The end of the input is indicated by a zero.*

Output. *The output should be composed of lines each corresponding to an input line, except the last zero. An output line includes the number of representations for the input integer as the sum of 1 or more consecutive prime numbers. No other characters should be inserted in the output.*

Problem 68 ([WW16], pp. 9–10: I think I need a houseboat). *FRED MAPPER is considering purchasing some land in Louisiana to build his house on. In the process of investigating the land, he learned that the state of Louisiana is actually shrinking by 50 square miles each year, due to erosion caused by the Mississippi River. Since FRED is hoping to live in this house for the rest of his life, he needs to know if his land is going to be lost to erosion.*

After doing more research, FRED has learned that the land that is being lost forms a semicircle. This semicircle is part of a circle centered at (0,0), with the line that bisects the circle being the x axis. Locations below the x axis are in the water. The semicircle has an area of 0 at the beginning of year 1.

Input. *The 1st line of input will be a positive integer indicating how many data sets will be included N. Each of the next N lines will contain the x,y Cartesian coordinates of the land FRED is considering. These will be floating-point numbers measured in miles. The y coordinate will be nonnegative. (0,0) will not be given.*

Output. *For each data set, a single line of output should appear. This line should take the form of*

Property N: This property will begin eroding in year Z.

where N is the data set (counting from 1) & Z is the 1st year (start from 1) this property will be within the semicircle AT THE END OF YEAR Z. Z must be an integer. After the last data set, this should print out “END OF OUTPUT.”

Source. ACM Mid-Atlantic United States 2001.

Note. *No property will appear exactly on the semicircle boundary: it will be either inside or outside. This problem will be judged automatically. Your answer must match exactly, including the capitalization, punctuation, & white space. This includes the periods at the ends of the lines. All locations are given in miles.*

Problem 69 ([WW16], p. 12, hangover). *How far can you make a stack of cards overhang a table? If you have 1 card, you can create a maximum overhang of half a card length. (We’re assuming that the cards must be perpendicular to the table.) With 2 cards, you can make the top card overhang the bottom one by half a card length, & the bottom one overhang the table by a third of a card length, for a total maximum overhang of $\frac{1}{2} + \frac{1}{3} = \frac{5}{6}$ card lengths. In general, you can make n cards overhang by $\sum_{i=2}^{n+1} \frac{1}{i} = \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n+1}$ card lengths, where the top card overhangs the 2nd by $\frac{1}{2}$, the 2nd overhangs the 3rd by $\frac{1}{3}$, the 3rd overhangs the 4th by $\frac{1}{4}$, & so on, & the bottom card overhangs the table by $\frac{1}{n+1}$.*

Input. *The input consists of 1 or more test cases, followed by a line containing the number 0.00 that signals the end of the input. Each test case is a single line containing a positive floating-point number c whose value is at least 0.01 & at most 5.20; c will contain exactly 3 digits.*

Output. For each test case, output the minimum number of cards necessary to achieve an overhang of at least c card lengths. Use the exact output format shown in the examples.

Problem 71 ([WW16], p. 17, specialized 4-digit numbers). Find & list all 4-digit numbers in decimal notation that have the property that the sum of their 4 digits equals the sum of their digits when represented in hexadecimal (base 16) notation & also equals the sum of their digits when represented in duodecimal (base 12) notation. E.g., the number 2991 has the sum of (decimal) digits $2 + 9 + 9 + 1 = 21$. Since $2991 = 1 \cdot 1728 + 8 \cdot 144 + 9 \cdot 12 + 3$, its duodecimal representation is $\overline{1893}_{12}$, & these digits also sum up to 21. But in hexadecimal, 2991 is \overline{BAF}_{16} , & $11 + 10 + 15 = 36$, so 2991 should be rejected by your program. The next 2992, however, has digits that sum to 22 in all 3 representations (including $\overline{BB0}_{16}$), so 2992 should be on the listed output. (We don't want decimal numbers with fewer than 4 digits – excluding leading zeros – so that 2992 is the 1st correct answer.)

Input. There is no input for this problem.

Output. Your output is to be 2992 & all larger 4-digit numbers that satisfy the requirements (in strictly increasing order), each on a separate line, with no leading or trailing blanks, ending with a new-line character. There are to be no blank lines in the output. The 1st few lines of the output are shown below:

6.1 Solving Ad Hoc Problems by Mechanism Analysis

Problem 73 ([[WW18](#)], 1.1.1, p. 1, Factstone Benchmark). AMTEL has announced that it will release a 128-bit computer chip by 2010, a 256-bit computer by 2020, & so on, continuing its strategy of doubling the word size every 10 years. (AMTEL released a 64-bit computer in 2000, a 32-bit computer in 1990, a 16-bit computer in 1980, an 8-bit computer in 1970, & a 4-bit computer, its 1st, in 1960.) AMTEL will use a new benchmark – the Factstone – to advertise the vastly improved capacity of its new chips. The Factstone rating is defined to be the largest integer n such that $n!$ can be represented as an unsigned integer in a computer word. Given a year $1960 \leq y \leq 2160$, what will be the Factstone rating of AMTEL’s most recently released chip?

Input. There are several test cases. For each test case, there is 1 line of input containing y . A line containing 0 follows that last test case.

Output. For each test case, output a line giving the Factstone rating.

Bài toán 12 ([[WW18](#)], 1.1.1, p. 1, Điểm chuẩn Factstone). AMTEL đã thông báo rằng họ sẽ phát hành 1 con chip máy tính 128-bit vào năm 2010, 1 máy tính 256-bit vào năm 2020, & cứ thế, tiếp tục chiến lược tăng gấp đôi kích thước từ sau mỗi 10 năm. (AMTEL đã phát hành 1 máy tính 64-bit vào năm 2000, 1 máy tính 32-bit vào năm 1990, 1 máy tính 16-bit vào năm 1980, 1 máy tính 8-bit vào năm 1970, & 1 máy tính 4-bit, máy tính đầu tiên của họ, vào năm 1960.) AMTEL sẽ sử dụng 1 chuẩn mực mới – Factstone – để quảng cáo cho khả năng được cải thiện đáng kể của các con chip mới của mình. Xếp hạng Factstone được định nghĩa là số nguyên n lớn nhất sao cho $n!$ có thể được biểu diễn dưới dạng 1 số nguyên không dấu trong 1 từ máy tính. Với năm $1960 \leq y \leq 2160$, xếp hạng Factstone của chip mới nhất được phát hành của AMTEL sẽ là bao nhiêu?

Đầu vào. Có 1 số trường hợp thử nghiệm. Đối với mỗi trường hợp thử nghiệm, có 1 dòng đầu vào chứa y . Một dòng chứa 0 theo sau trường hợp thử nghiệm cuối cùng đó.

Đầu ra. Đối với mỗi trường hợp thử nghiệm, đầu ra là 1 dòng cho biết xếp hạng Factstone.

Analysis. For a given year $y \in [1960, 2160] \cap \mathbb{N}$, 1st the number of bits for the computer in this year is calculated, & then the largest integer n , i.e., the Factstone rating, that $n!$ can be represented as an unsigned integer in a computer word is calculated. Since the computer was a 4-bit computer in 1960 & AMTEL doubles the word size every 10 years, the number of bits for the computer in year y is $b = 2^{\lfloor \frac{y-1960}{10} \rfloor} \in \mathbb{N}^*$. The largest unsigned integer for b -bit is $2^b - 1 \in \mathbb{N}^*$. If $n!$ is the largest unsigned integer $\leq 2^b - 1$, then n is the Factstone rating in year y . There are 2 calculation methods:

1. Calculate $n!$ directly, which is slow & easily leads to overflow.
2. Logarithms are used to calculate $n!$, based on the following inequality

$$n! \leq 2^b - 1 \Rightarrow \log_2 n! = \sum_{i=1}^n \log_2 i = \log_2 1 + \log_2 2 + \dots + \log_2 n \leq \log_2 (2^b - 1) < \log_2 2^b = b,$$

n can be calculated by a loop: Initially $i := 1$, repeat $++i$, & $\log_2 i$ is accumulated until the sum is $> b$. Then $i - 1$ is the Factstone rating.

Codes:

- C++: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/C++/Factstone_benchmark.cpp.

```
#include <stdio.h>
#include <math.h>

int main() {
    int y;
    while (1 == scanf("%d", &y) && y) { // input test cases
        double w = log(4);
        for (int Y = 1960; Y <= y; Y += 10)
            w *= 2;
        int i = 1; // accumulation log2 i until > w
        double f = 0; // f: sum of accumulation for log2 i
        while (f < w)
            f += log((double)++i);
        printf("%d\n", i - 1); // output Factstone rating
    }
    if (y) printf("fishy ending %d\n", y);
}
```

- Python:

Bài toán 13 (Mở rộng [WW18], 1.1.1, p. 1, Điểm chuẩn Factstone). AMTEL đã thông báo rằng kể từ năm $y_0 \in \mathbb{N}^*$ cho trước, họ sẽ phát hành 1 con chip b^{b^0} -“bit” computer (“bit” ở đây được hiểu theo nghĩa rộng là theo cơ số $b \in \mathbb{N}^*$, $b \geq 2$, chứ không phải hệ nhị phân 2-bit), \mathcal{E} cứ sau δ_y năm \mathcal{E} δ_m tháng ($\delta_m \in \overline{1, 11}$), số “bit” sẽ gấp $b \in \mathbb{N}$, $b \geq 2$ lên so với trước đó. AMTEL sẽ sử dụng 1 chuẩn mực mới – Factstone – để quảng cáo cho khả năng được cải thiện đáng kể của các con chip mới của mình. Xếp hạng Factstone được định nghĩa là số nguyên n lớn nhất sao cho $n!$ có thể được biểu diễn dưới dạng 1 số nguyên không dấu trong 1 từ máy tính. Với năm $y_0 \leq y$, xếp hạng Factstone của chip mới nhất được phát hành của AMTEL sẽ là bao nhiêu?

Đầu vào. Có 1 số trường hợp thử nghiệm. Đối với mỗi trường hợp thử nghiệm, có 1 dòng đầu vào chứa y . Một dòng chứa 0 theo sau trường hợp thử nghiệm cuối cùng đó.

Đầu ra. Đối với mỗi trường hợp thử nghiệm, đầu ra là 1 dòng cho biết xếp hạng Factstone.

Remark 4 (log: product \mapsto sum). When you encounter a product function of n , i.e., $f(n)$, e.g. $n!$ above, use logarithm to transform products into sums.

Question 4 (Sum \Leftrightarrow Product). Làm sao để chuyển 1 tổng thành 1 tích? Làm sao chuyển 1 tích thành 1 tổng?

Answer. Chuyển tổng thành tích: $e^{a+b} = e^a e^b$, $\forall a, b \in \mathbb{R}$. Tổng quát:

$$e^{\sum_{i=1}^n a_i} = \prod_{i=1}^n e^{a_i}, \forall a_i \in \mathbb{R}, \forall n \in \mathbb{N}^*, \forall i = 1, \dots, n.$$

Chuyển tích thành tổng: $\ln(ab) = \ln a + \ln b$, $\forall a, b \in (0, \infty)$. Tổng quát:

$$\ln \prod_{i=1}^n a_i = \sum_{i=1}^n \ln a_i, \forall a_i \in (0, \infty), \forall n \in \mathbb{N}^*, \forall i = 1, \dots, n.$$

Note: Có thể thay $\ln x$ bởi $\log x$, $\log_a x$ với $a \in (0, \infty)$ bất kỳ. □

Problem 74 ([WW18], 1.1.2, p. 3, Bridge). Consider that n people wish to cross a bridge at night. A group of at most 2 people may cross at any time, & each group must have a flashlight. Only 1 flashlight is available among the n people, so some sort of shuttle arrangement must be arranged in order to return the flashlight so that more people may cross.

Each person has a different crossing speed; the speed of a group is determined by the speed of the slower member. Your job is to determine a strategy that gets all n people across the bridge in the minimum time.

Input. The 1st line of input contains n , followed by n lines giving the crossing times for each of the people. There are not more than 1000 people, & nobody takes more than 100 seconds to cross the bridge.

Output. The 1st line of output must contain the total number of seconds required for all n people to cross the bridge. The following lines give a strategy for achieving this time. Each line contains either 1 or 2 integers, indicating which person or people form the next group to cross. (Each person is indicated by the crossing time specified in the input. Although many people may have the same crossing time, the ambiguity is of no consequence.) Note that the crossings alternate directions, as it is necessary to return the flashlight so that more may cross. If more than 1 strategy yields the minimal time, any one will do.

IDs for Online Judge. Waterloo local 2000.09.30

Bài toán 14 ([WW18], 1.1.2, p. 3, “Đi cầu”). Hãy xem xét n người muốn đi qua cầu vào ban đêm. Một nhóm tối đa 2 người có thể đi qua bất kỳ lúc nào, & mỗi nhóm phải có 1 chiếc đèn pin. Chỉ có 1 chiếc đèn pin trong số n người, vì vậy phải sắp xếp 1 số loại hình sắp xếp đưa đón để trả lại đèn pin để nhiều người hơn có thể đi qua.

Mỗi người có tốc độ đi qua khác nhau; tốc độ của 1 nhóm được xác định bởi tốc độ của thành viên chậm hơn. Nhiệm vụ của bạn là xác định 1 chiến lược giúp tất cả n người đi qua cầu trong thời gian ngắn nhất.

Đầu vào. Dòng 1 của đầu vào chứa n , theo sau là n dòng cho biết thời gian đi qua của mỗi người. Không có quá 1000 người, & không ai mất hơn 100 giây để đi qua cầu.

Đầu ra. Dòng 1 của đầu ra phải chứa tổng số giây cần thiết để tất cả n người đi qua cầu. Các dòng sau đưa ra 1 chiến lược để đạt được thời gian này. Mỗi dòng chứa 1 hoặc 2 số nguyên, cho biết người hoặc những người nào tạo thành nhóm tiếp theo để vượt sông. (Mỗi người được chỉ định theo thời gian vượt sông được chỉ định trong đầu vào. Mặc dù nhiều người có thể có cùng thời gian vượt sông, nhưng sự mơ hồ không quan trọng.) Lưu ý rằng các lần vượt sông thay đổi hướng, vì cần phải trả lại đèn pin để nhiều người có thể vượt sông. Nếu có nhiều hơn 1 chiến lược tạo ra thời gian tối thiểu, bất kỳ chiến lược nào cũng được.

Computer Science Analysis. The strategy that gets all n people, numbered P_1, \dots, P_n , across the bridge in the minimum time is: fast people should return the flashlight to help slow people. Because a group of ≤ 2 people may cross the bridge each time, we solve the problem by analyzing members of groups. 1st, n people's crossing times, denoted by t_1, \dots, t_n , are sorted in descending order: $t_{i_1} \geq t_{i_2} \geq \dots \geq t_{i_n}$ where (i_1, \dots, i_n) is some rearrangement of $(1, \dots, n)$, i.e., $\{i_1, \dots, i_n\} = \{1, \dots, n\}$. Suppose that in the current sequence (i.e., after some people have crossed the bridge & hence being not counted in the current sequence), A, B are the current fastest person P_A & the current 2nd fastest person P_B 's crossing times, respectively, a, b are the current slowest person P_a & the current 2nd slowest person P_b 's crossing time, respectively. Obviously, $A < B < b < a$. There are 2 methods for making the current slowest person & the current 2nd slowest person to cross the bridge:

• **Method 1:** The fastest person P_A helps the slowest person P_a & the 2nd slowest person P_b to cross the bridge. The steps:

1. The fastest person P_A & the slowest person P_a cross the bridge, which takes time $\max\{A, a\} = a$.
2. The fastest person P_A is back, which takes time A .
3. The fastest person P_A & the 2nd slowest person P_b cross the bridge, which takes time $\max\{A, b\} = b$.
4. The fastest person is back, which takes time A .

It takes times $a + A + b + A = 2A + a + b$.

• **Method 2:** The fastest person P_A & the 2nd fastest person P_B help the current slowest person P_a & the current 2nd slowest person P_b to cross the bridge. The steps:

1. The fastest person P_A & the 2nd fastest person P_B cross the bridge, which takes time $\max\{A, B\} = B$.
2. The fastest person P_A is back & returns the flashlight to the slowest person P_a & the 2nd slowest person P_b , which takes time A .
3. The slowest person P_a & the 2nd slowest person P_b cross the bridge & give the flashlight to the 2nd fastest person P_B , which takes time $\max\{a, b\} = a$.
4. The 2nd faster person P_B is back, which takes time B .

It takes time $B + A + a + B = 2B + A + a$. Note: In Method 2, the roles of the fastest person P_A & the 2nd fastest person P_B are the same & hence they will take the same time, indeed: $B + B + a + A = 2B + a + A$.

Each time, we need to compare Method 1 & Method 2. If $2A + a + b < 2B + A + a \Leftrightarrow A + b < 2B$, then we use Method 1, else we use Method 2 (in the case $2A + a + b = 2B + A + a \Leftrightarrow A + b = 2B$, either of them can be used). & each time the current slowest person & the current 2nd slowest person cross the bridge. Finally, there are 2 cases depending on n being even or odd (since only 2 persons can cross the bridge in each turn):

- Case 1: If there are only 2 persons who need to cross the bridge, then the 2 persons cross the bridge. It takes time B .
- Case 2: There are 3 persons who need to cross the bridge. 1st, the fastest person & the slowest person cross the bridge. Then, the fastest person is back. Finally, the last 2 persons cross the bridge. It takes time $\max\{A, a\} + A + \max\{A, b\} = a + A + b$.

Mathematical Analysis.

- C++:

6.2 Solving Ad Hoc Problems by Statistical Analysis

Unlike mechanism analysis, statistical analysis begins with a partial solution to the problem, & the overall global solution is found based on analyzing the partial solution. Solving problems by statistical analysis is a bottom-up method.

– Không giống như phân tích cơ chế, phân tích thống kê bắt đầu bằng 1 giải pháp cục bộ cho vấn đề, & giải pháp toàn cục tổng thể được tìm thấy dựa trên việc phân tích giải pháp cục bộ. Giải quyết vấn đề bằng phân tích thống kê là phương pháp từ dưới lên.

Problem 75 ([WW18], 1.2.1., p. 6, Ants). *An army of ants walk on a horizontal pole of length l cm, each with a constant speed of 1 cm/s. When a walking ant reaches an end of the pole, it immediately falls off it. When 2 ants meet, they turn back & start walking in opposite directions. We know the original positions of ants on the pole; unfortunately, we do not know the directions in which the ants are walking. Your task is to compute the earliest & the latest possible times needed for all ants to fall off the pole.*

Input. *The 1st line of input contains 1 integer giving the number of cases that follow. The data for each case start with 2 integer numbers: the length of pole (in cm) & n , the number of ants residing on the pole. These 2 numbers are followed by n integers giving the position of each ant on the pole as the distance measured from the left end of the pole, in no particular order. All input integers are $\leq 10^6$, & they are separated by whitespace.*

Output. *For each case of input, output 2 numbers separated by a single space. The 1st number is the earliest possible time when all ants fall off the pole (if the directions of their walks are chosen appropriately), & the 2nd number is the latest possible such time.*

Bài toán 15 ([WW18], 1.2.1., p. 6, Kiến). *Một đội quân kiến đi trên 1 cột nằm ngang dài l cm, mỗi con có tốc độ không đổi là 1 cm/s. Khi 1 con kiến đi đến 1 đầu của cột, nó ngay lập tức rơi khỏi cột. Khi 2 con kiến gặp nhau, chúng quay lại & bắt đầu đi theo hướng ngược nhau. Chúng ta biết vị trí ban đầu của các con kiến trên cột; thật không may, chúng ta không biết hướng mà các con kiến đang đi. Nhiệm vụ của bạn là tính toán thời gian sớm nhất & thời gian muộn nhất có thể cần thiết để tất cả các con kiến rơi khỏi cột.*

Đầu vào. Dòng 1 của đầu vào chứa 1 số nguyên cho biết số trường hợp theo sau. Dữ liệu cho mỗi trường hợp bắt đầu bằng 2 số nguyên: chiều dài của cột (tính bằng cm) & n , số kiến trú ngụ trên cột. 2 số này được theo sau bởi n số nguyên cho biết vị trí của mỗi con kiến trên cột là khoảng cách được đo từ đầu bên trái của cột, không theo thứ tự cụ thể. Tất cả các số nguyên đầu vào là $\leq 10^6$, & chúng được phân cách bằng khoảng trắng.

Đầu ra. Đối với mỗi trường hợp đầu vào, đầu ra 2 số được phân cách bằng 1 khoảng trắng. Số thứ nhất là thời gian sớm nhất có thể khi tất cả các con kiến rơi khỏi cột (nếu hướng đi của chúng được chọn 1 cách thích hợp), & số thứ 2 là thời gian muộn nhất có thể như vậy.

Analysis.

Problem 76 ([WW18], 1.3.1., pp. 12–13, Perfection). *From the article Number Theory in the 1994 Microsoft Encarta: “If $a, b, c \in \mathbb{Z}$ s.t. $a = bc$, a is called a multiple of b or of c , & b or c is called a divisor or factor of a . If $c \neq \pm 1$, b is called a proper divisor of a .*

Chương 7

VNOI

Bài toán 16 (gcd in Pascal triangle – ƯCLN trong tam giác Pascal, <https://oj.vnoi.info/problem/gpt>). Tam giác Pascal là 1 cách sắp xếp hình học của các hệ số nhị thức vào 1 tam giác. Hàng thứ $n \in \mathbb{N}$ của tam giác bao gồm các hệ số trong khai triển của đa thức $f(x, y) = (x + y)^n$. I.e., phần tử tại cột thứ k , hàng thứ n của tam giác Pascal là $C_n^k = \binom{n}{k}$, i.e., tổ hợp chập k của n phần tử $0 \leq k \leq n$. Cho $n \in \mathbb{N}$. Tính $\text{GPT}(n)$ là ƯCLN của các số nằm giữa 2 số 1 trên hàng thứ n của tam giác Pascal.

Input. Dòng đầu ghi T là số lượng test. T dòng tiếp theo, mỗi dòng ghi 1 số nguyên n .

Output. Gồm T dòng, mỗi dòng ghi $\text{GPT}(n)$ tương ứng.

Constraint. $1 \leq T \leq 20$, $2 \leq n \leq 10^9$.

Phân tích. Công thức khai triển nhị thức Newton: $(a + b)^n = \sum_{i=0}^n C_n^i a^{n-i} b^i$, $\forall n \in \mathbb{N}$, see, e.g., [Wikipedia/binomial theorem](#). Cần tính $\gcd(\{C_n^i; 1 \leq i \leq n-1\}) = \gcd(C_n^1, C_n^2, \dots, C_n^{n-1})$. Chú ý mỗi hàng của tam giác Pascal có tính chất đối xứng nên chỉ cần xét “1 nửa” là đủ. Cụ thể hơn: $C_n^k = C_n^{n-k}$, $\forall k \in \mathbb{N}$, $k \leq n$, nên

$$\{C_n^1, \dots, C_n^{n-1}\} = \{C_n^1, \dots, C_n^{\lfloor \frac{n}{2} \rfloor}\} = \begin{cases} \{C_n^1, \dots, C_n^{\frac{n-1}{2}}\} & \text{if } n \not\equiv 2, \\ \{C_n^1, \dots, C_n^{\frac{n}{2}}\} & \text{if } n \equiv 2, \end{cases}$$

nên thay vì xét $i = 1, \dots, n-1$, chỉ cần xét $i = 1, \dots, \lfloor \frac{n}{2} \rfloor$ là đủ.

Codes:

- C++: https://github.com/NQBH/advanced_STEM_beyond/blob/main/OLP_ICPC/C++/gcd_Pascal_triangle.cpp.

Theorem 1.

$$\gcd\{C_n^i\}_{i=1}^{n-1} = \begin{cases} p & \text{if } n = p^k \text{ for some prime } p \text{ \& some } n \in \mathbb{N}^*, \\ 1 & \text{if } n \neq p^k \text{ for all prime } p \text{ \& any } n \in \mathbb{N}^*. \end{cases}$$

Recurrence Relation – Quan Hệ Hồi Quy

Contents

8.1 Linear recurrence with constant coefficients – Hồi quy tuyến tính với hệ số hằng	39
--	----

Resources – Tài nguyên.

1. [AB20]. DORIN ANDRICA, OVIDIU BAGDASAR. *Recurrent Sequences: Key Results, Applications, & Problems*.

Let X be an arbitrary set. A function $f : \mathbb{N} \rightarrow X$ defines a *sequence* $(x_n)_{n=0}^{\infty}$ of elements of X , where $x_n = f(n)$, $\forall n \in \mathbb{N}$. The set of all sequences with elements in X is denoted by $X^{\mathbb{N}}$, while X^n denotes Cartesian product of n copies of X , where X will be chosen as \mathbb{C} , the Euclidean space \mathbb{R}^m , the algebra $M_r(A)$ of the $r \times r$ matrices with entries in a ring A , etc. The set $X^{\mathbb{N}}$ has numerous important subsets. E.g., when $X = \mathbb{R}$, the set of real numbers $\mathbb{R}^{\mathbb{N}}$ includes sequences which are bounded, monotonous, convergent, positive, nonzero, periodic, etc.

– Cho X là 1 tập hợp tùy ý. Một hàm $f : \mathbb{N} \rightarrow X$ định nghĩa 1 dãy $(x_n)_{n=0}^{\infty}$ các phần tử của X , trong đó $x_n = f(n)$, $\forall n \in \mathbb{N}$. Tập hợp tất cả các dãy có các phần tử trong X được ký hiệu là $X^{\mathbb{N}}$, trong khi X^n biểu thị tích Descartes của n bản sao của X , trong đó X sẽ được chọn là \mathbb{C} , không gian Euclidean \mathbb{R}^m , đại số $M_r(A)$ của các ma trận $r \times r$ có các phần tử trong vành A , v.v. Tập hợp $X^{\mathbb{N}}$ có nhiều tập con quan trọng. Ví dụ, khi $X = \mathbb{R}$, tập hợp các số thực $\mathbb{R}^{\mathbb{N}}$ bao gồm các dãy số bị chặn, đơn điệu, hội tụ, dương, khác không, tuần hoàn, v.v.

When $a \in X$ is fixed, in *implicit form*, a recurrence relation is defined by

$$F_n(x_n, x_{n-1}, \dots, x_0) = a, \quad \forall n \in \mathbb{N}^*, \quad (8.1)$$

where $F_n : X^{n+1} \rightarrow X$ is a function of $n + 1$ variables, $n \in \mathbb{N}^*$. In general, the implicit form of a recurrence relation does not define uniquely the sequence $(x_n)_{n=0}^{\infty}$.

The *explicit form* of a recurrence relation is

$$x_n = f_n(x_{n-1}, \dots, x_0), \quad \forall n \in \mathbb{N}^*, \quad (8.2)$$

where $f_n : X^n \rightarrow X$ is a function, $\forall n \in \mathbb{N}^*$. The relations (8.2) give the rule to construct the term x_n of the sequence $(x_n)_{n \geq 0}$ from the 1st term x_0 : $x_1 = f_1(x_0)$, $x_2 = f_2(x_1, x_0)$, \dots , i.e., (8.2) is a functional type relation.

In mathematics, a *recurrence relation* is an equation according to which the n th term of a sequence of numbers is equal to some combination of the previous terms, i.e.:

$$\begin{cases} u_0 \in \mathbb{F}, \\ u_n = f_n(n, u_0, u_1, \dots, u_{n-1}), \quad \forall n \in \mathbb{N}^*, \end{cases} \quad (8.3)$$

if u_0 is the initial element, which is an element of the given field \mathbb{F} , of the sequence $\{u_n\}_{n=0}^{\infty}$, where $f_n : \mathbb{N}^* \times \mathbb{F}^n \rightarrow \mathbb{F}$ is a scalar-valued function of $(n + 1)$ -dimensional-vector-valued argument, $\forall n \in \mathbb{N}^*$; &

$$\begin{cases} u_1 \in \mathbb{F}, \\ u_n = f_n(n, u_1, \dots, u_{n-1}), \quad \forall n \in \mathbb{N}, \quad n \geq 2, \end{cases} \quad (8.4)$$

if u_1 is the initial element, which is an element of the given field \mathbb{F} , of the sequence $\{u_n\}_{n=1}^{\infty}$, where $f_n : \mathbb{N}_{\geq 2} \times \mathbb{F}^{n-1} \rightarrow \mathbb{F}$ is a scalar-valued function of n -dimensional-vector-valued argument, $\forall n \in \mathbb{N}$, $n \geq 2$.

Question 5. What define uniquely (8.3)?

Answer. The solutions $\{u_n\}_{n=0}^{\infty}$ defined by (8.3), are uniquely determined in terms of $u_0 \in \mathbb{F}$, $\{f_n\}_{n=1}^{\infty}$. Analogously, the solutions $\{u_n\}_{n=0}^{\infty}$ defined by (8.4), are uniquely determined in terms of $u_1 \in \mathbb{F}$, $\{f_n\}_{n=2}^{\infty}$. \square

Remark 5 (Starting index of a sequence). *The starting index of a sequence $\{u_n\}_{n \in \{0,1\}}^{\infty}$ can be 0, which is commonly used in Computer Science & various programming languages, or 1, which is commonly used in Mathematics.*

Often, only k previous terms of the sequence appear in the equation, for a parameter k that is independent of n ; this number k is called the *order* of the relation. If the values of the 1st k numbers in the sequence have been given, the rest of the sequence can be calculated by repeatedly applying the equation.

In *linear recurrences*, the n th term is equated to a **linear function** of the k previous terms. A famous example is the recurrence for the **Fibonacci numbers**

$$\begin{cases} F_0 = F_1 = 1, \\ F_n = F_{n-1} + F_{n-2}, \quad \forall n \in \mathbb{N}, n \geq 2, \end{cases} \quad (\text{Fib})$$

where the order $k = 2$ & the linear function merely adds the 2 previous terms. This example is a **linear recurrence with constant coefficients**, because the coefficients of the linear function (1 & 1) are constants that do not depend on n . For these recurrences, one can express the general term of the sequence as a **closed-form expression** of n . **Linear recurrences with polynomial coefficients** depending on n are also important, because many common [elementary functions] & **special functions** have a **Taylor series** whose coefficients satisfy such a recurrence relation (see **Wikipedia/holonomic function**).

Def: Solving a recurrence relation means obtaining a **closed-form solution**: a non-recursive function of n .

The concept of a recurrence relation can be extended to **multidimensional arrays**, i.e., **indexed families** that are indexed by **tuples** of naturals.

Definition 1 (Recurrence relation). *A recurrence relation is an equation that expresses each element of a sequence as a function of preceding ones. More precisely, in the case where only the immediately preceding element is involved, a 1st order recurrence relation has the form*

$$\begin{cases} u_0 \in X, \\ u_n = \varphi(n, u_{n-1}), \quad \forall n \in \mathbb{N}^*, \end{cases} \quad (8.5)$$

where $\varphi : \mathbb{N} \times X \rightarrow X$ is a function, where X is a set to which the elements of a sequence must belong. For any $u_0 \in X$, this defines a unique sequence with u_0 as its 1st element, called the *initial value*, which is easy to modify the definition for getting sequences starting from the term of index 1 or higher.

A recurrence relation of order $k \in \mathbb{N}^*$ has the form

$$\begin{cases} u_0, u_1, \dots, u_{k-1} \in X, \\ u_n = \varphi(n, k, u_{n-1}, u_{n-2}, \dots, u_{n-k}), \quad \forall n \in \mathbb{N}, n \geq k, \end{cases} \quad (8.6)$$

where $\varphi : \mathbb{N}^2 \times X^k \rightarrow X$ is a function that involves k consecutive elements of the sequence. In this case, k initial values are needed for defining a sequence.

Remark 6 (Explicit- vs. implicit recurrence relations). *The explicit recurrence relations are the recurrence relations that can be given as (8.3) or (8.4); meanwhile the implicit recurrence relations are the recurrence relations that can be given as*

$$\begin{cases} u_0 \in \mathbb{F}, \\ f_n(n, u_0, u_1, \dots, u_{n-1}, u_n) = 0, \quad \forall n \in \mathbb{N}^*, \end{cases} \quad (8.7)$$

if u_0 is the initial element, which is an element of the given field \mathbb{F} , of the sequence $\{u_n\}_{n=0}^{\infty}$, where $f_n : \mathbb{N}^* \times \mathbb{F}^{n+1} \rightarrow \mathbb{F}$ is a scalar-valued function of $(n+1)$ -dimensional-vector-valued argument, $\forall n \in \mathbb{N}^*$; &

$$\begin{cases} u_1 \in \mathbb{F}, \\ f_n(n, u_1, \dots, u_{n-1}, u_n) = 0, \quad \forall n \in \mathbb{N}, n \geq 2, \end{cases} \quad (8.8)$$

if u_1 is the initial element, which is an element of the given field \mathbb{F} , of the sequence $\{u_n\}_{n=1}^{\infty}$, where $f_n : \mathbb{N}_{\geq 2} \times \mathbb{F}^n \rightarrow \mathbb{F}$ is a scalar-valued function of n -dimensional-vector-valued argument, $\forall n \in \mathbb{N}, n \geq 2$. The wellposednesses of (8.7) & (8.8) require that the corresponding recurrent equation has a unique solution to be able to define u_n uniquely.

Example 1 (Factorial). The **factorial** is defined by the recurrence relation $n! = n \cdot (n-1)!$, which is (8.5) with $X = \mathbb{N}^*$, $u_0 = 0! = 1$, $\varphi(x, y) = xy$, $\forall x, y \in X = \mathbb{N}^*$ so that $u_n = \varphi(n, u_{n-1}) = nu_{n-1} = n(n-1)! = n!$, $\forall n \in \mathbb{N}^*$. This is an example of a linear recurrence with polynomial coefficients of order 1, with the simple polynomial (in n) n as its only coefficient.

Example 2 (Logistic map). An example of a recurrence relation is the *logistic map* defined by

$$\begin{cases} x_0 \in \mathbb{R}, \\ x_{n+1} = rx_n(1 - x_n), \end{cases} \quad (\text{lg})$$

for a given constant r . The behavior of the sequence depends dramatically on r , but is stable when the initial condition x_0 varies (proofs?)

8.1 Linear recurrence with constant coefficients – Hồi quy tuyến tính với hệ số hằng

See, e.g., [Wikipedia/linear recurrence with constant coefficients](#). In mathematics (including combinatorics, linear algebra, & dynamical system), a *linear recurrence with constant coefficients* (also known as a *linear recurrence relation* or *linear difference equation*) sets equal to 0 a *polynomial* that is linear in the various iterates of a variable – i.e., in the values of the elements of a sequence. The polynomial's linearity means that each of its terms has degree 0 or 1. A linear recurrence denotes the evolution of some variable over time, with the current *time period* or discrete moment in time denoted as t , 1 period earlier denoted as $t - 1$, 1 period later as $t + 1$, etc.

The *solution* of such an equation is a function of t , & not of any iterate values, giving the value of the iterate at any time. To find the solution, it is necessary to know the specific values (known as *initial conditions*) of n of the iterates, & normally these are the n iterates that are oldest. The equation or its variable is said to be *stable* if from any set of initial conditions the variable's limit as time goes to ∞ exists; this limit is called the *steady state*.

Difference equations are used in a variety of contexts, e.g. in *economics* to model the evolution through time of variables e.g. *gross domestic product*, the *inflation rate*, the *exchange rate*, etc. They are used in modeling such *time series* because values of these variables are only measured at discrete intervals. In *econometric* applications, linear difference equations are modeled with *stochastic terms* in the form of *autoregressive (AR) models* & in models e.g. *vector autoregression (VAR)* & *autoregressive moving average (ARMA)* models that combine AR with other features.

Definition 2 (Linear recurrence with constant coefficients). A linear recurrence with constant coefficients is an equation of the following form, written in terms of parameters a_1, \dots, a_n, b :

$$y_n = \sum_{i=1}^k a_i y_{n-i} + b, \quad (8.9)$$

or equivalently as

$$y_{n+k} = \sum_{i=1}^n a_i y_{n+k-i} + b, \quad (8.10)$$

Dynamic programming (DP) is used to solve optimization problems. DP breaks an optimization problem into a sequence of related subproblems, solves these subproblems just once, stores solutions to subproblems, & constructs an optimal solution to the problem, based on solutions to subproblems. The method for storing solutions to subproblems is called *memorization*. When the same subproblem occurs, its solution can be used directly.

– Lập trình động (DP) được sử dụng để giải quyết các bài toán tối ưu hóa. DP chia 1 bài toán tối ưu hóa thành 1 chuỗi các bài toán con có liên quan, giải các bài toán con này chỉ 1 lần, lưu trữ các giải pháp cho các bài toán con, & xây dựng 1 giải pháp tối ưu cho bài toán, dựa trên các giải pháp cho các bài toán con. Phương pháp lưu trữ các giải pháp cho các bài toán con được gọi là ghi nhớ. Khi cùng 1 bài toán con xảy ra, giải pháp của nó có thể được sử dụng trực tiếp.

There are 2 characteristics for a problem solved by DP:

1. Optimization: An optimal solution to a problem consists of optimal solutions to subproblems.
2. No aftereffect: A solution to a subproblem is only related to solutions to its direct predecessors.

– Có 2 đặc điểm cho 1 bài toán được giải quyết bằng DP:

1. Tối ưu hóa: Một giải pháp tối ưu cho 1 bài toán bao gồm các giải pháp tối ưu cho các bài toán con.
2. Không có hậu quả: Một giải pháp cho 1 bài toán con chỉ liên quan đến các giải pháp cho các bài toán tiền nhiệm trực tiếp của nó.

Dynamic Programming experiments are organized as follows:

- Linear Dynamic Programming,
- Tree-Like Dynamic Programming,
- Dynamic Programming with State Compression.

– Các thí nghiệm DP được tổ chức như sau:

- Quy hoạch động tuyến tính,
- Quy hoạch động dạng cây,
- Quy hoạch động với nén trạng thái.

9.1 Linear Dynamic Programming – Quy Hoạch Động Tuyến Tính

Basic concepts for DP & the method for linear DP are as follows.

1. *Stage k & state s_k* : The solution to a problem is divided into k orderly & related stages. In a stage there are several states. State s_k is a state in stage k .
 - *Giai đoạn k & trạng thái s_k* : Giải pháp cho 1 vấn đề được chia thành k giai đoạn có thứ tự & liên quan. Trong 1 giai đoạn có 1 số trạng thái. Trạng thái s_k là trạng thái trong giai đoạn k .
2. *Decision u_k & available decision set $D_k(s_k)$* : The choice from a state in stage $k - 1$ (the current stage) to a state in stage k (the next stage) is called *decision u_k* . Normally, a state can be reachable through more than 1 decision from the last stage, & such decisions constitute an available decision set $D_k(s_k)$. A decision sequence from the initial state to the goal state is called a *strategy*.
 - *Quyết định u_k & tập quyết định khả dụng $D_k(s_k)$* : Lựa chọn từ trạng thái ở giai đoạn $k - 1$ (giai đoạn hiện tại) đến trạng thái ở giai đoạn k (giai đoạn tiếp theo) được gọi là *quyết định u_k* . Thông thường, 1 trạng thái có thể đạt được thông qua nhiều hơn 1 quyết định từ giai đoạn cuối cùng, & các quyết định như vậy tạo thành 1 tập quyết định khả dụng $D_k(s_k)$. Trình tự quyết định từ trạng thái ban đầu đến trạng thái mục tiêu được gọi là *chiến lược*.
3. *Successor Function & Optimization*. A successor function is used to describe the transition from stage $k - 1$ to stage k . The DP method is used to solve some optimization problems. Successor functions are used to find a solution with the optimal (minimum or maximum) value to a problem. A successor function can be formally defined as follows:

$$f_k(s_k) = \text{opt}_{u_k \in D_k(s_k)} g(f_{k-1}(T_k(s_k, u_k)), u_k),$$

where $T_k(s_k, u_k)$ is a state s_{k-1} in stage $k - 1$ which relates to state s_k through decision u_k , & $f_{k-1}(T_k(s_k, u_k))$ is an optimal solution, $g(x, u_k)$ is a function for value x & decision u_k , i.e., $g(f_{k-1}(T_k(s_k, u_k)))$ is a function from state s_{k-1} to state s_k through decision u_k ; *opt* means optimization; & $f_1(s_1)$ is an initial value. Because u_k is 1 decision in a decision set $D_k(s_k)$, all decisions are enumerated to get the optimal solution to s_k . From the initial state, successor functions are used to get the optimal solution f_n (goal state) to the problem finally.

– *Hàm kế thừa & Tối ưu hóa*. Hàm kế thừa được sử dụng để mô tả quá trình chuyển đổi từ giai đoạn $k - 1$ sang giai đoạn k . Phương pháp DP được sử dụng để giải 1 số bài toán tối ưu hóa. Hàm kế thừa được sử dụng để tìm giải pháp có giá trị tối ưu (tối thiểu hoặc tối đa) cho 1 bài toán. Một hàm kế thừa có thể được định nghĩa chính thức như sau:

$$f_k(s_k) = \text{opt}_{u_k \in D_k(s_k)} g(f_{k-1}(T_k(s_k, u_k)), u_k),$$

trong đó $T_k(s_k, u_k)$ là trạng thái s_{k-1} ở giai đoạn $k - 1$ liên quan đến trạng thái s_k thông qua quyết định u_k , & $f_{k-1}(T_k(s_k, u_k))$ là 1 giải pháp tối ưu, $g(x, u_k)$ là 1 hàm cho giá trị x & quyết định u_k , tức là, $g(f_{k-1}(T_k(s_k, u_k)))$ là 1 hàm từ trạng thái s_{k-1} đến trạng thái s_k thông qua quyết định u_k ; *opt* có nghĩa là tối ưu hóa; & $f_1(s_1)$ là giá trị ban đầu. Vì u_k là 1 quyết định trong tập quyết định $D_k(s_k)$, tất cả các quyết định đều được liệt kê để có được giải pháp tối ưu cho s_k . Từ trạng thái ban đầu, các hàm kế thừa được sử dụng để có được giải pháp tối ưu f_n (trạng thái mục tiêu) cho bài toán cuối cùng.

If the stages are in linear order, linear DP is used to solve the problem.

– Nếu các giai đoạn theo thứ tự tuyến tính, DP tuyến tính được sử dụng để giải quyết vấn đề.

```

1  for (every state i is processed in linear order) {
2      for (every state j in state i is enumerated (j\in S_i)) {
3          for (every state k in stage i - 1 which is related to state j is enumerated (k\in S_{i-1})) {
4              calculate f_i(j) = opt_{u_k\in D_k(k)} g(f_{i-1}(k), u_k);
5          }
6      }
7  }
```

Problem 77 (Brackets sequence, [WW18], p. 261). Define a regular brackets sequence in the following way:

1. An empty sequence is a regular sequence.

2. If S is a regular sequence, then (S) & $[S]$ are both regular sequences.

3. If A, B are regular sequences, then AB is a regular sequence.

E.g., all of the following sequences of characters are regular brackets sequences: $()$, $[\]$, $(())$, $([\])$, $()[\]$, $()[(\)]$

9.2 Problem: Dynamic Programming – Bài Tập: Quy Hoạch Động

Bài toán 17 ([[Thu+21b](#)], p. 441). (a) Tìm $(x, y) \in \mathbb{R}^2$ thỏa $x^2 + y^2 \leq 1$ để $x + y$ đạt GTNN, GTLN. (b) Tìm $(x, y) \in \mathbb{R}^2$ thỏa $x^2 + y^2 \leq r^2$ để $x + y$ đạt GTNN, GTLN với $r \in (0, \infty)$. (c) Phát biểu ý nghĩa hình học của bài toán.

Phát biểu bài toán tối ưu/bài toán quy hoạch:

$$\begin{aligned} \max_{x^2+y^2 \leq r^2} x + y &= \sqrt{2}, \quad \arg \max_{x^2+y^2 \leq r^2} x + y = \left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}} \right), \\ \min_{x^2+y^2 \leq r^2} x + y &= -\sqrt{2}, \quad \arg \min_{x^2+y^2 \leq r^2} x + y = \left(-\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}} \right), \end{aligned}$$

Definition 3 (Fibonacci sequences). Fibonacci sequences are defined by

$$\begin{cases} F_0 = 0, & F_1 = 1, \\ F_n = F_{n-1} + F_{n-2}, & \forall n \in \mathbb{N}, n \geq 2. \end{cases}$$

Definition 4 (Lucas sequences). The sequence of Lucas numbers are defined by

$$\begin{cases} L_0 = 2, & L_1 = 1, \\ L_n = L_{n-1} + L_{n-2}, & \forall n \in \mathbb{N}, n \geq 2. \end{cases}$$

Bài toán 18 (Fibonacci numbers – Số Fibonacci). (a) Tính dãy số Fibonacci & dãy Lucas bằng: (i) Truy hồi $O(a^n)$ với $a \approx 1.61803$. (ii) Quy hoạch động $O(n)$. (iii) Quy hoạch động cải tiến. (b) Trong mỗi thuật toán, tính cụ thể số lần gọi hàm tính F_i, L_i , với $i = 0, 1, \dots, n$, số phép cộng đã thực hiện. Tính time- & space complexities. (c) Mở rộng bài toán cho dãy số truy hồi cấp 2 với hệ số hằng $\{u_n\}_{n=1}^\infty$ được xác định bởi:

$$\begin{cases} u_0 = \alpha, & u_1 = \beta, \\ u_{n+2} = au_{n+1} + bu_n, & \forall n \in \mathbb{N}, \end{cases}$$

với $a, b, \alpha, \beta \in \mathbb{C}$ cho trước. (d) Mở rộng bài toán cho dãy số truy hồi cấp 2 với hệ số thay đổi $\{u_n\}_{n=1}^\infty$ được xác định bởi:

$$\begin{cases} u_0 = \alpha, & u_1 = \beta, \\ u_n = a(n)u_{n-1} + b(n)u_{n-2}, & \forall n \in \mathbb{N}, n \geq 2. \end{cases}$$

với $\alpha, \beta \in \mathbb{C}$, $a, b : \mathbb{N}_{\geq 2} \rightarrow \mathbb{C}$ là 2 hàm giá trị phức cho trước.

Chứng minh. Cho $n \in \mathbb{N}$. Đặt $f(n, i)$ là số lần xuất hiện (frequency) của F_i khi tính F_n bằng công thức truy hồi. Để chứng minh bằng phương pháp quy nạp Toán học: $f(n, n-i) = F_{i+1}$, $\forall i = 0, 1, \dots, n$.

- Số lần call hàm truy hồi $= \sum_{i=0}^n f_{n-i} = \sum_{i=0}^n F_{i+1} = \sum_{i=1}^{n+1} F_i = F_{n+3} - 1$.
- Số lần thực hiện phép cộng $= F_{n+1} - 1$.
- Tồn $n+1$ ô nhớ để chứa F_0, F_1, \dots, F_n .

Bài toán 19 ([Tru23a], Đăk Nông THCS 2022–2023, 4: virus, p. 32). *Flashback* là 1 loại virus máy tính sinh sản rất nhanh khi gặp môi trường thuận lợi & là 1 loại virus nguy hiểm, có tốc độ lây lan nhanh trong môi trường mạng. Flashback lần đầu được phát hiện vào năm 2011 bởi công ty diệt virus Intego dưới dạng 1 bản cài đặt flash giả & chúng sinh sản theo quy luật:

- Ngày đầu tiên (ngày thứ 0) có n cá thể ở mức 1.
- Ở mỗi ngày tiếp theo, mỗi cá thể mức i sinh ra i cá thể mức 1, các cá thể mới sẽ sinh sôi, phát triển từ ngày hôm sau.
- Bản thân cá thể thứ i sẽ phát triển thành mức $i + 1$ & chu kỳ phát triển trong ngày chấm dứt.

Requirement. Xác định sau k ngày trong môi trường có bao nhiêu cá thể.

Input. Vào từ file `flashback.inp` gồm: Dòng 1 chứa số bộ test $t \in \mathbb{N}^*$. t dòng tiếp theo, mỗi dòng chứa $n, k \in \mathbb{N}^*$, ràng buộc $n \in [1000], k \leq [10^5]$.

Output. Ghi ra file `flashback.out` 1 số nguyên duy nhất là số dư của kết quả tìm được chia cho $10^9 + 7$.

Limit.

- Subtask 1: có 40% số test ứng với $n \leq 100, k \leq 1000$.
- Subtask 2: có 60% số test ứng với $n \leq 1000, k \leq 10^5$.

Sample.

flashback.inp	flashback.out
5	65
5 3	130
10 3	170
5 4	2563
11 6	232767
999 6	

(a) Mô tả thành mô hình toán học. (b) Viết chương trình C/C++, Pascal, Python để giải.

Chứng minh. Gọi $a(d, l)$ là số cá cá thể ở mức l vào ngày d (d : day, l : level). Thiết lập công thức truy hồi:

$$\text{Kết quả cuối cùng: } n(F_1 + \sum_{i=1}^k F_{2i}) = n \sum_{i=1}^k F_{2i} = nF_{2k+1}.$$

□

Bài toán 20 ([Tru23a], Hà Nội HSG9 2021–2022, 5: cổ phiếu VNI, p. 37). Bình mua bán cổ phiếu VNI trên thị trường chứng khoán. Giả sử giá của 1 cổ phiếu VNI trong $n \in \mathbb{N}^*$ ngày lần lượt là a_1, a_2, \dots, a_n . Biết mỗi ngày Bình chỉ thực hiện 1 trong 3 hoạt động:

1. Mua 1 cổ phiếu VNI
2. Bán số lượng cổ phiếu bất kỳ mà Bình đang sở hữu
3. Không thực hiện bất kỳ giao dịch nào.

Requirement. Bình thực hiện mua bán cổ phiếu VNI như thế nào để thu được lợi nhuận lớn nhất nếu Bình tham gia mua bán bắt đầu từ ngày thứ $t \in \mathbb{N}^*$ cho trước?

Input. Đọc từ file `vni.inp` gồm:

- Dòng 1: $n \in [10^5]$ là số ngày biết giá cổ phiếu.
- Dòng 2: gồm n số nguyên dương a_1, a_2, \dots, a_n tương ứng là giá cổ phiếu VNI trong từng ngày $a_i \in [10^9]$, $1 \leq i \leq n$.
- Dòng 3: $q \in [10^5]$ là số lượng truy vấn.
- q dòng tiếp theo, mỗi dòng gồm $t \in [n]$ thể hiện cho ngày đầu tiên mà Bình tham gia mua bán cổ phiếu VNI.

Output. Ghi ra file `vni.out` gồm q dòng, mỗi dòng 1 số nguyên duy nhất là lợi nhuận lớn nhất mà Bình thu được ở mỗi truy vấn tương ứng.

Limit.

- Subtask 1: có 50% số test tương ứng $n \in [10^3]$, $q = 1$.
- Subtask 2: có 30% số test tương ứng $n \in [10^5]$, $q = 1$.
- Subtask 3: có 20% số test còn lại không có ràng buộc gì thêm.

Bài toán 21 ([Tru23a], BRVT HSG9 2022–2023, 2: đồ vui tin học, p. 57). Để tổng kết phát thưởng cho cuộc thi Đồ vui Tin học. Ban tổ chức có $n \in \mathbb{N}^*$ phần quà được đánh số thứ tự từ 1 đến n , phần quà thứ i có giá trị là a_i . Ban tổ chức yêu cầu học sinh chọn các phần quà theo quy tắc:

- Phần quà chọn sau phải có số thứ tự lớn hơn phần quà chọn trước đó.
- Phần quà chọn sau phải có giá trị lớn hơn phần quà chọn trước đó ít nhất k giá trị.

Requirement. Giúp các học sinh lựa chọn theo quy tắc ban tổ chức đặt ra sao cho số lượng phần quà được chọn là nhiều nhất.

Input. Vào từ file `gift.inp`:

- Dòng 1 chứa số bộ test $t \in \mathbb{N}^*$.
- Với mỗi bộ test:
 - Dòng 1 chứa $n \in [10^4], k \in [10^3]$.
 - Dòng 2 chứa n số nguyên dương $a_i \in [10^6]$ là giá trị của phần quà thứ i , $\forall i \in [n]$.

Output. Ghi ra file `gift.out` 1 dòng duy nhất chứa số lượng phần quà nhiều nhất thỏa mãn yêu cầu của Ban tổ chức.

Bài toán 22 ([Tru23a], BRVT HSG9 2022–2023, 3: trò chơi, p. 58). Nhân dịp kỷ niệm ngày thành lập Đoàn, cô Tổng phụ trách tổ chức 1 trò chơi có thưởng cho các bạn lớp 9: Có $n \in \mathbb{N}^*$ ô vuông được vẽ thẳng hàng trên sân trường, các ô vuông được đánh số thứ tự từ 1 đến n . Mỗi ô vuông i có giá trị năng lượng là h_i . 1 học sinh đang ở ô thứ i , bạn ấy có thể nhảy tới ô vuông tiếp theo theo các cách:

- Nếu đang ở ô thứ i , có thể nhảy đến ô vuông thứ tự $i + 1, i + 2, \dots, i + k$.
- Chi phí năng lượng tiêu hao cho 1 lần nhảy là $|h_i - h_j|$ với h_j là ô đích mà bạn nhảy tới.

Học sinh nào di chuyển từ ô 1 đến ô n với chi phí năng lượng thấp nhất sẽ được cô thưởng 1 phần quà.

Yêu cầu. Tìm chi phí thấp nhất để giúp các học sinh nhảy từ ô vuông thứ 1 đến ô vuông thứ n .

Input. Vào từ file `game.inp`:

- Dòng 1 chứa số bộ test $t \in \mathbb{N}^*$.
- Với mỗi bộ test:
 - Dòng 1 chứa $2 \leq n \leq 10^5, k \in [100]$, lần lượt là số ô vuông & số ô vuông tối đa mà học sinh có thể nhảy qua.
 - Dòng 2 chứa n giá trị $h_i \in [10^4]$, mỗi số cách nhau 1 ký tự trắng là chi phí năng lượng của ô thứ i , $\forall i \in [n]$.

Output. Ghi ra file `game.out` 1 số nguyên là chi phí năng lượng ít nhất.

Định nghĩa 1 (Dãy phần tử cực trị của 1 dãy số thực cho trước). Cho dãy số thực $\{a_i\}_{i=1}^n$. Dãy phần tử lớn nhất của dãy số thực $\{a_i\}_{i=1}^n$ được định nghĩa bởi:

$$a_i^{\max} := \max_{i \leq j \leq n} a_j.$$

Tương tự, dãy phần tử nhỏ nhất của dãy số thực $\{a_i\}_{i=1}^n$ được định nghĩa bởi:

$$a_i^{\min} := \min_{i \leq j \leq n} a_j.$$

Bài toán 26 ([[Tru23b](#)], HSG12 Nam Định 2020–2021, 4: work, pp. 21–2). Trong 1 dây chuyền làm việc của công ty có n công nhân làm n việc. Người ta đánh số cho công nhân từ 1 đến n theo thứ tự đứng trong dây chuyền. Thời gian hoàn thành 1 công việc của người thứ i là t_i phút. Mỗi người cần làm xong công việc của mình nhưng được quyền làm tối đa 2 việc. Vì thế họ có thể phối hợp với người đứng ngay trước mình cùng làm, nếu người thứ i & người thứ $i + 1$ phối hợp thì thời gian làm xong việc cho 2 người là p_i .

Bài toán 27 ([[Thu+21b](#)], p. 446, tính C_n^k). (a) Viết chương trình C/C++, Python để tính C_n^k – số tổ hợp chập k của n phần tử bằng công thức truy hồi nhờ đẳng thức Pascal:

$$C_n^k = \begin{cases} 1 & \text{if } k = 0 \vee k = n, \\ C_{n-1}^k + C_{n-1}^{k-1} & \text{if } 0 < k < n, \end{cases}$$

với $n, k \in \mathbb{N}$, $0 \leq k \leq n$, được nhập vào. (b) Có thể sử dụng mảng 1 chiều để lưu lại dòng trước đó mà không cần phải lưu lại tất cả.

Bài toán 28 ([[Thu+21b](#)], II.1, p. 447, tìm dãy con đơn điệu tăng dài nhất). Cho dãy số nguyên $a = \{a_i\}_{i=1}^n = a_1, \dots, a_n$ gồm $n \in \mathbb{N}^*$ phần tử. 1 dãy con của a là 1 cách chọn trong a 1 số phần tử giữ nguyên thứ tự (có tất cả 2^n dãy con của 1 dãy có n phần tử). Tìm dãy con đơn điệu tăng (resp., giảm, không tăng, không giảm) của a có độ dài lớn nhất.

CS solution. Giả sử dãy ban đầu gồm $a[1], a[2], \dots, a[n]$. Bổ sung vào a 2 phần tử $a[0] = -\infty$ & $a[n+1] = \infty$ (khi viết chương trình $\pm\infty$ sẽ được cài đặt các giá trị thích hợp). Khi đó dãy con đơn điệu tăng dài nhất sẽ bắt đầu từ $a[0]$ & kết thúc ở $a[n+1]$. Đặt $l(i)$ là độ dài dãy con đơn điệu tăng dài nhất bắt đầu từ $a[i]$, $\forall i = 0, 1, \dots, n+1$. Cần tính tất cả $l(i)$ này. Đáp số bài toán sẽ là dãy ứng với $l(i_0)$ có GTLN.

Cơ sở quy hoạch động (bài toán nhỏ nhất). Trường hợp đặc biệt, $l(n+1)$ là độ dài dãy con đơn điệu tăng dài nhất bắt đầu tại $a[n+1] = \infty$. Do dãy con này chỉ gồm 1 phần tử ∞ nên $l(n+1) = 1$.

Công thức truy hồi. Cần tính $l(i)$ với $i = n, \dots, 1, 0$. Giá trị $l(i)$ sẽ được tính trong điều kiện $l(i+1), \dots, l(n+1)$ đã biết. Dãy con đơn điệu tăng dài nhất bắt đầu từ $a[i]$ sẽ được thành lập bằng cách lấy $a[i]$ ghép vào đầu 1 trong số các dãy con đơn điệu tăng dài nhất bắt đầu từ vị trí $a[j] > a[i]$ (để đảm bảo tính tăng) nào đó đứng sau $a[i]$ & chọn dãy dài nhất trong số đó để ghép $a[i]$ vào đầu để đảm bảo tính dài nhất. Nên $l(i)$ được tính bằng cách xét tất cả các chỉ số $j = i+1, \dots, n+1$ mà $a[j] > a[i]$, chọn ra chỉ số j_{\max} có $l(j_{\max})$ lớn nhất:

$$l(i) = l(j_{\max}) + 1 = \max\{l(j); i < j \leq n+1, a[i] < a[j]\} + 1.$$

□

Bài toán 29 ([[Thu+21b](#)], II.1.4.1., p. 451, bố trí phòng họp). Có $n \in \mathbb{N}^*$ cuộc họp, cuộc họp thứ i bắt đầu vào thời điểm s_i (start) & kết thúc vào thời điểm f_i (final). Do chỉ có 1 phòng hội thảo nên 2 cuộc họp bất kỳ sẽ được cùng bố trí phục vụ nếu khoảng thời gian làm việc của chúng chỉ giao nhau tại 1 đầu mút. Bố trí phòng họp để phục vụ được nhiều cuộc họp nhất.

Bài toán 30 ([[Thư+21b](#)], II.1.4.2., p. 451, cho thuê máy). Trung tâm tính toán hiệu năng cao nhận được đơn đặt hàng của $n \in \mathbb{N}^*$ khách hàng. Khách hàng i muốn sử dụng máy trong khoảng thời gian từ s_i (start) đến f_i (final) & trả tiền thuê là c_i . Bố trí lịch thuê máy để tổng số tiền thu được là lớn nhất mà thời gian sử dụng máy của 2 khách bất kỳ được phục vụ đều không giao nhau.

Bài toán 31 ([[Thư+21b](#)], II.1.4.3., p. 451, dây tam giác bao nhau). Cho $n \in \mathbb{N}^*$ tam giác trên mặt phẳng. Tam giác i bao tam giác j nếu 3 đỉnh của tam giác j đều nằm trong tam giác i (có thể nằm trên cạnh). Tìm dãy tam giác bao nhau có nhiều tam giác nhất.

Problem 78 (CSES Problem Set/dice combinations). Count the number of ways to construct sum $n \in \mathbb{N}^*$ by throwing a dice 1 or more times. Each throw produces an outcome between 1 & 6. E.g., if $n = 3$, there are 4 ways: $3 = 1 + 1 + 1 = 1 + 2 = 2 + 1 = 3$.

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print the number of ways module $10^9 + 7$.

Constraints. $n \in [10^6]$.

Problem 79 (CSES Problem Set/minimizing coins). Consider a money system consisting of n coins. Each coin has a positive integer value. Your task is to produce a sum of money x using the available coins in such a way that the number of coins is minimal. E.g., if the coins are $\{1, 5, 7\}$ & the desired sum is 11, an optimal solution is $5 + 5 + 1$ which requires 3 coins.

Input. The 1st input line has 2 integer $n, x \in \mathbb{N}^*$: the number of coins & the desired sum of money. The 2nd line has n distinct integers $\{c_i\}_{i=1}^n = c_1, c_2, \dots, c_n$: the value of each coin.

Output. Print 1 integer: the minimum number of coins. If it is not possible to produce the desired sum, print -1.

Constraints. $n \in [100], x \in [10^6], c_i \in [10^6]$.

Sample.

4 10 4 8 5 3 5 12 8 1	13

Problem 85 (CSES Problem Set/array description). You know that an array has $n \in \mathbb{N}^*$ integers in $[m]$, & the absolute difference between 2 adjacent values is at most 1. Given a description of the array where some values may be unknown, count the number of arrays that match the description.

Input. The 1st input line has integers $n, m \in \mathbb{N}^*$: the array size & the upper bound for each value. The next line has n integers $x_1, x_2, \dots, x_n \in \mathbb{N}^*$: the contents of the array. Value 0 denotes an unknown value.

Output. Print 1 integer: the number of arrays module $10^9 + 7$.

Constraints. $n \in [10^5], m \in [100], x_i \in \{0, 1, \dots, m\}, \forall i \in [n]$.

Sample.

array_description.inp	array_description.out
3 5 2 0 2	3

Explanation: The arrays $[2, 1, 2]$, $[2, 2, 2]$, $[2, 3, 2]$ match the description.

Problem 86 (CSES Problem Set/counting towers). Build a tower whose width is 2 & height is n . You have an unlimited supply of blocks whose width & height are integers. Given n , how many different towers can you build? Mirrored & rotated towers are counted separately if they look different.

Input. The 1st input line has integers $t \in \mathbb{N}^*$: the number of tests. After this, there are t lines, & each line contains an integer $n \in \mathbb{N}^*$: the height of the tower.

Output. For each test, print the number of towers module $10^9 + 7$.

Constraints. $t \in [100]$, $n \in [10^6]$.

Problem 87 (CSES Problem Set/edit distance). The edit distance between 2 strings is the minimum number of operations required to transform 1 string into the other. The allowed operations are:

- Add 1 character to the string.
- Remove 1 character from the string.
- Replace 1 character in the string.

E.g., the edit distance between LOVE & MOVIE is 2, because you can 1st replace L with M, & then add I. Calculate the edit distance between 2 strings.

Input. The 1st input line has a string that contains $n \in \mathbb{N}^*$ characters between A-Z. The 2nd input line has a string that contains $m \in \mathbb{N}^*$ characters between A-Z.

Output. Print 1 integer: the edit distance between the strings.

Constraints. $m, n \in [5000]$.

Sample.

10 20 15 17 35 25 40 12 19 13 12	5

Problem 95 (CSES Problem Set/increasing subsequence). You are given an array containing $n \in \mathbb{N}^*$ integers. Determine the longest increasing subsequence in the array, i.e., the longest subsequence where every element is larger than the previous one. A subsequence is a sequence that can be derived from the array by deleting some elements without changing the order of the remaining elements.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the size of the array. After this there are n integers x_1, x_2, \dots, x_n : the contents of the array.

Output. Print the length of the longest increasing subsequence.

Constraints. $n \in [2 \cdot 10^5], x_i \in [10^9], \forall i \in [n]$.

Sample.

increasing_subsequence.inp	increasing_subsequence.out

Problem 96 (CSES Problem Set/projects). There are $n \in \mathbb{N}^*$ you can attend. For each project, you know its starting & ending days & the amount of money you would get as reward. You can only attend 1 project during a day. What is the maximum amount of money you can earn?

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of projects. After this, there are n lines. Each such line has 3 integers $a_i, b_i, p_i \in \mathbb{N}^*$: the starting day, the ending day, & the reward.

Output. Print 1 integer: the maximum amount of money you can earn.

Constraints. $n \in [2 \cdot 10^5], a_i, b_i, p_i \in [10^9], a_i \leq b_i, \forall i \in [n]$.

Sample.

Problem 97 (CSES Problem Set/elevator rides). There are $n \in \mathbb{N}^*$ people who want to get to the top of a building which has only 1 elevator. You know the weight of each person & the maximum allowed weight in the elevator. What is the minimum number of elevator rides?

Input. The 1st input line has 2 integers $n, x \in \mathbb{N}^*$: the number of people & the maximum allowed weight in the elevator. The 2nd line has n integers w_1, w_2, \dots, w_n : the weight of each person.

Output. Print 1 integer: the minimum number of rides.

Constraints. $n \in [20], x \in [10^9], w_i \in [x]$.

Sample.

Problem 98 (CSES Problem Set/counting tilings). Count the number of ways you can fill an $n \times m$ grid using 1×2 & 2×1 tiles.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$:

Output. Print 1 integer: the number of ways module $10^9 + 7$.

Constraints. $n \in [10], m \in [1000]$.

Sample.

counting_tiling.inp	counting_tiling.out
4 7	781

Problem 99 (CSES Problem Set/counting numbers). Count the number of integers between $a, b \in \mathbb{N}^*$ where no 2 adjacent digits are the same.

Input. The 1st input line has 2 integers $a, b \in \mathbb{N}^*$:

Output. Print 1 integer: the answer to the problem.

Constraints. $0 \leq a \leq b \leq 10^{18}$.

Sample.

counting_number.inp	counting_number.out

Problem 100 (CSES Problem Set/increasing subsequence II). Given an array of $n \in \mathbb{N}^*$ integers, calculate the number of increasing subsequences it contains. If 2 subsequences have the same values but in different positions in the array, they are counted separately.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the size of the array. The 2nd line has n integers x_1, x_2, \dots, x_n : the contents of the array.

Output. Print 1 integer: the number of increasing subsequences module $10^9 + 7$.

Constraints. $n \in [2 \cdot 10^5], x_i \in [10^9]$.

Sample.

increasing_subsequence_II.inp	increasing_subsequence_II.out

2 1 3	

Explanation: The increasing subsequences are $[2], [1], [3], [2, 3], [1, 3]$.

Bài toán 32 (VNOI/cắt hình chữ nhật). Người ta dùng máy cắt để cắt 1 hình chữ nhật kích thước $m \times n$, với $m, n \in [5000]$, thành 1 số ít nhất các hình vuông có kích thước nguyên dương & có các cạnh song song với cạnh hình chữ nhật ban đầu. Máy cắt khi cắt luôn cắt theo phương song song với 1 trong 2 cạnh của hình chữ nhật & chia hình chữ nhật thành 2 phần.

Input. Gồm 2 số là kích thước m, n cách nhau bởi dấu cách.

Output. Ghi số k là số hình vuông nhỏ nhất được tạo ra.

Sample.

cut_rectangle.inp	cut_rectangle.out

Problem 103 (CSES Problem Set/building roads). Byteland has n cities, & m roads between them. Goal: construct new roads so that there is a route between any 2 cities. Task: find out the minimum number of roads required, & also determine which roads should be built.

Input. The 1st input line has 2 integers n, m : the number of cities & roads. The cities are numbered $1, 2, \dots, n$. After that, there are m lines describing the roads. Each line has 2 integers a, b : there is a road between those cities. A road always connects 2 different cities, & there is at most 1 road between any 2 cities.

Output. 1st print an integer k : the number of required roads. Then, print k lines that describe the new roads. You can print any valid solution.

Constraints. $1 \leq n \leq 10^5, 1 \leq m \leq 2 \cdot 10^5, 1 \leq a, b \leq n$.

Problem 104 (<https://cses.fi/problemset/task/1667>CSES Problem Set/message route). Syrjälä's network has n computers & m connections. Task: find out if Uolevi can send a message to Maija, & if it is possible, what is the minimum number of computers on such a route.

Input. The 1st input line has 2 integers n, m : the number of computers & connections. The computers are numbered $1, 2, \dots, n$. Uolevi's computer is 1 & Maija's computer is n . Then, there are m lines describing the connections. Each line has 2 integers a, b : there is a connection between those computers. Every connection is between 2 different computers, & there is at most 1 connection between any 2 computers.

Output. If it is possible to send a message, 1st print k : the minimum number of computers on a valid route. After this, print an example of such a route. You can print any valid solution. If there are no routes, print IMPOSSIBLE.

Constraints. $2 \leq n \leq 10^5, 1 \leq m \leq 2 \cdot 10^5, 1 \leq a, b \leq n$.

Problem 105 (CSES Problem Set/building team). There are n pupils in Uolevi's class, & m friendships between them. Task: divide pupils into 2 teams in such a way that no 2 pupils in a team are friends. You can freely choose the sizes of the teams.

Input. The 1st input line has 2 integers n, m : the number of pupils & friendships. The pupils are numbered $1, 2, \dots, n$. Then, there are m lines describing the friendships. Each line has 2 integers a, b : pupils a, b are friends. Every friendship is between 2 different pupils. You can assume that there is at most 1 friendship between any 2 pupils.

Output. Print an example of how to build the teams. For each pupil, print 1 or 2 depending on to which team the pupil will be assigned. You can print any valid team. If there are no solutions, print IMPOSSIBLE.

Constraints. $1 \leq n \leq 10^5, 1 \leq m \leq 2 \cdot 10^5, 1 \leq a, b \leq n$.

Problem 107 (CSES Problem Set/monsters). You & some monsters are in a labyrinth. When taking a step to some direction in the labyrinth, each monster may simultaneously take 1 as well. Goal: reach 1 of the boundary squares without ever sharing a square with a monster. Task: find out if your goal is possible, & if it is, print a path that you can follow. Your plan has to work in any situation; even if the monsters know your path beforehand.

Input. The 1st input line has 2 integers n, m : the height & width of the map. After this there are n lines of m characters describing the map. Each character is . (floor), # (wall), A (start), or M (monster). There is exactly 1 A in the input.

Output. 1st print YES if your goal is possible, & NO otherwise. If your goal is possible, also print an example of a valid path (the length of the path & its description using characters D, U, L, R). You can print any path, as long as its length is at most mn steps.

Constraints. $1 \leq m, n \leq 10^3$.

Sample. Input:

```

```

Problem 108 (CSES Problem Set/shortest routes I). There are n cities & m flight connections between them. Task: determine the length of the shortest route from Syrjälä to every city.

Input. The 1st input line has 2 integers n, m : the number of cities & flight connections. The cities are numbered $1, 2, \dots, n$, & city 1 is Syrjälä. After that, there are m lines describing the flight connections. Each line has 3 integers a, b, c : a flight begins at city a , ends at city b , & its length is c . Each flight is a 1-way flight. You can assume that it is possible to travel from Syrjälä to all other cities.

Output. Print n integers: the shortest route lengths from Syrjälä to cities $1, 2, \dots, n$.

Constraints. $1 \leq n \leq 10^5, 1 \leq m \leq 2 \cdot 10^5, 1 \leq a, b \leq n, 1 \leq c \leq 10^9$.

Problem 109 (CSES Problem Set/shortest routes II). There are n cities & m roads between them. Task: process q queries where you have to determine the length of the shortest route between 2 given cities.

Input. The 1st input line has 3 integers n, m, q : the number of cities, roads, & queries. Then, there are m lines describing the roads. Each line has 3 integers a, b, c : there is a road between cities a & b whose length is c . All roads are 2-way roads. Finally, there are q lines describing the queries. Each line has 2 integers a, b : determine the length of the shortest route between cities a & b .

Output. Print the length of the shortest route for each query. If there is no route, print -1 instead.

Constraints. $1 \leq n \leq 500, 1 \leq m \leq n^2, 1 \leq q \leq 10^5, 1 \leq a, b \leq n, 1 \leq c \leq 10^9$.

Problem 111 (CSES Problem Set/flight discount). Task: find a minimum-price flight route from Syrjälä to Metsälä. You have 1 discount coupon, using which you can halve the price of any single flight during the route. However, you can only use the coupon once. When you use the discount coupon for a flight whose price is x , its price becomes $\lfloor \frac{x}{2} \rfloor$.

Input. The 1st input line has 2 integers n, m : the number of cities & flight connections. The cities are numbered $1, 2, \dots, n$. City 1 is Syrjälä, & city n is Metsälä. After this there are m lines describing the flights. Each line has 3 integers a, b, c : a flight begins at city a , ends at city b , & its price is c . Each flight is unidirectional. You can assume that it is always possible to get from Syrjälä to Metsälä.

Output. *Print 1 integer: the price of the cheapest route from Syrjälä to Metsälä.*

Constraints. $1 \leq n \leq 10^5, 1 \leq m \leq 2 \cdot 10^5, 1 \leq a, b \leq n, 1 \leq c \leq 10^9$.

Problem 118 (CSES Problem Set/investigation). You are going to travel from Syrjälä to Lehmälä by plane. You would like to find answers to the following questions:

- What is the minimum price of such a route?
- How many minimum-price routes are there? (modulo $10^9 + 7$)?
- What is the minimum number of flights in a minimum-price route?
- What is the maximum number of flights in a minimum-price route?

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of cities & the number of flights. The cities are numbered $1, 2, \dots, n$. City 1 is Syrjälä, & city n is Lehmälä. After this, there are m lines describing the flights. Each line has 3 integers $a, b, c \in \mathbb{N}^*$: there is a flight from city a to city b with price c . All flights are 1-way flights. You may assume that there is a route from Syrjälä to Lehmälä.

Output. Print 4 integers according to the problem statement.

Constraints. $n \in [10^5], m \in [2 \cdot 10^5], a, b \in [n], c \in [10^9]$.

Problem 119 (CSES Problem Set/planets queries I). You are playing a game consisting of $n \in \mathbb{N}^*$ planets. Each planet has a teleporter to another planet (or the planet itself). process $q \in \mathbb{N}^*$ queries of the form: when you begin on planet x & travel through $k \in \mathbb{N}^*$ teleporters, which planet will you reach?

Input. The 1st input line has 2 integers $n, q \in \mathbb{N}^*$: the number of planets & queries. The planets are numbered $1, 2, \dots, n$. The 2nd line has n integers t_1, t_2, \dots, t_n : for each planet, the destination of the teleporter. It is possible that $t_i = i$. Finally, there are q lines describing the queries. Each line has 2 integers $x, k \in \mathbb{N}^*$: you start on planet x & travel through k teleporters.

Output. Print the answer to each query.

Constraints. $n, q \in [2 \cdot 10^5], x \in [n], k \in [0, 10^9], t_i \in [n], \forall i \in [n]$.

Problem 120 (CSES Problem Set/planet queries II). You are playing a game consisting of $n \in \mathbb{N}^*$ planets. Each planet has a teleporter to another planet (or the planet itself). You have to process $q \in \mathbb{N}^*$ queries of the form: You are now on planet a & want to reach planet b . What is the minimum number of teleportations?

Input. The 1st input line has 2 integers $n, q \in \mathbb{N}^*$: the number of the number of planets & queries. The planets are numbered $1, 2, \dots, n$. The 2nd line contains n integers t_1, t_2, \dots, t_n : for each planet, the destination of the teleporter. Finally, there are q lines describing the queries. Each line has 2 integers $a, b \in \mathbb{N}^*$: you are now on planet a & want to reach planet b .

Output. For each query, print the minimum number of teleportations. If it is not possible to reach the destination, print -1 .

Constraints. $n, q \in [2 \cdot 10^5], a, b \in [n]$.

Problem 121 (CSES Problem Set/planets cycles). You are playing a game consisting of $n \in \mathbb{N}^*$ planets. Each planet has a teleporter to another planet (or the planet itself). You start on a planet & then travel through teleporters until you reach a planet that you have already visited before. Calculate for each planet the number of teleportations there would be if you started on that planet.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of planets. The planets are numbered $1, 2, \dots, n$. The 2nd line has n integers t_1, t_2, \dots, t_n : for each planet, the destination of the teleporter. It is possible that $t_i = i$.

Output. Print n integers according to the problem statement.

Constraints. $n \in [2 \cdot 10^5], t_i \in [n], \forall i \in [n]$.

Problem 122 (CSES Problem Set/road reparation). There are $n \in \mathbb{N}^*$ cities & $m \in \mathbb{N}^*$ roads between them. Unfortunately, the condition of the roads is so poor that they cannot be used. Repair some of the roads so that there will be a decent route between any 2 cities. For each road, you know its reparation cost, & you should find a solution where the total cost is as small as possible.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of cities & roads. The cities are numbered $1, 2, \dots, n$. Then, there are m lines describing the roads. Each line has 3 integers $a, b, c \in \mathbb{N}^*$: there is a road between cities a & b , & its reparation cost is c . All roads are 2-way roads. Every road is between 2 different cities, & there is at most 1 road between 2 cities.

Output. Print 1 integer: the minimum total reparation cost. However, if there are no solutions, print IMPOSSIBLE.

Constraints. $n \in [10^5], m \in [2 \cdot 10^5], a, b \in [n], c \in [10^9]$.

Problem 123 (CSES Problem Set/road construction). There are $n \in \mathbb{N}^*$ cities & initially no roads between them. However, every day a new road will be constructed, & there will be a total of $m \in \mathbb{N}^*$ roads. A component is a group of cities where there is a route between any 2 cities using the roads. After each day, find the number of components & the size of the largest component.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of cities & roads. The cities are numbered $1, 2, \dots, n$. Then, there are m lines describing the roads. Each line has 2 integers $a, b \in \mathbb{N}^*$: a new road is constructed between cities a, b . You may assume that every road will be constructed between 2 different cities.

Output. Print m lines: the required information after each day.

Constraints. $n \in [10^5], m \in [2 \cdot 10^5], a, b \in [n]$.

Problem 137 (IMO2007P3). In a mathematical competition some competitors are friends. Friendship is always mutual. Call a group of competitors a clique if each 2 of them are friends. (In particular, any group of < 2 competitors is a clique.) The number of members of a clique is called its size.

Give that, in this competition, the largest size of a clique is even, prove that the competitors can be arranged in 2 rooms s.t. the largest size of a clique contained in 1 room is the same as the largest size of a clique contained in the other room.

Bài toán 34 ([VL24], 3., p. 10, IMO2007P3). Trong 1 kỳ thi học sinh giỏi Toán, có vài thí sinh là bạn bè của nhau. Quan hệ bạn bè luôn là quan hệ 2 chiều. Gọi 1 nhóm các thí sinh là nhóm bạn bè nếu như 2 người bất kỳ trong nhóm này đều là bạn bè của nhau. (1 nhóm tùy ý có < 2 thí sinh cũng vẫn được coi là 1 nhóm bạn bè). Số lượng các thí sinh của 1 nhóm bạn bè được gọi là cỡ của nó. Cho biết trong kỳ thi này, cỡ của 1 nhóm bạn bè có nhiều người nhất là 1 số chẵn. Chứng minh: có thể xếp tất cả các thí sinh vào 2 phòng sao cho cỡ của nhóm bạn bè có nhiều người nhất trong phòng này cũng bằng cỡ của nhóm bạn bè có nhiều người nhất trong phòng kia.

Bài toán 35 (CP version of IMO2007P3). Cho $n \in \mathbb{N}^*$ người, được đánh số $1, 2, \dots, n$, tạo thành 1 đồ thị đơn vô hướng hữu hạn (finite undirected simple graph) $G = ([n], E)$. $e_{ij} \in E \Leftrightarrow$ người i & người j quen lẫn nhau, $\forall i, j \in [n]$. 1 nhóm bạn bè được định nghĩa là 1 đồ thị con đầy đủ (complete subgraph $G' = (V', E')$ với $V' \subset [n], |E'| = \frac{|V'|(|V'|-1)}{2}$), i.e., 2 đỉnh bất kỳ của G' được nối với nhau. Viết chương trình C/C++, Pascal, Python để tính bậc lớn nhất có thể có của 1 nhóm bạn bè. Sau đó tìm cách phân hoạch tập $[n]$ thành 2 tập con (tương ứng 2 phòng R_1, R_2) sao cho bậc lớn nhất của thể của 1 nhóm bạn bè trong mỗi phòng bằng nhau.

Input. Dòng 1 chứa số $n \in \mathbb{N}^*$. Dòng thứ $i \in [n]$ trong n dòng tiếp theo chứa các đỉnh nối với đỉnh i , i.e., tập láng giềng (neighborhood) của đỉnh i : $N(i) := \{j \in [n]; e_{ij} \in E\}$.

Output. Xuất ra dòng đầu tiên gồm 1 số nguyên dương: cỡ lớn nhất của nhóm bạn. 2 dòng tiếp theo chứa các đỉnh trong phòng R_1, R_2 thỏa mãn. Dòng cuối chứa cỡ lớn nhất chung của 2 phòng R_1, R_2 .

Range Queries – Truy Vấn Phạm Vi

Problem 138 (CSES Problem Set/static range sum queries). Given an array of $n \in \mathbb{N}^*$, process $q \in \mathbb{N}^*$ queries of the form: what is the sum of values in range $[a, b]$?

Input. The 1st input line has 2 integers $n, q \in \mathbb{N}^*$: the number of values & queries. The 2nd line has n integers x_1, x_2, \dots, x_n : the array values. Finally, there are q lines describing the queries. Each line has 2 integers a, b : what is the sum of values in range $[a, b]$?

Output. Print the result of each query.

Constraints. $n, q \in [2 \cdot 10^5], 1 \leq a \leq b \leq n, x_i \in [10^9], \forall i \in [n]$.

Tree Algorithms – Thuật Toán Trên Cây

Chương 13

Mathematics

Problem 145 (CSES/Josephus queries). Consider a game where there are $n \in \mathbb{N}^*$ children, numbered $1, 2, \dots, n$, in a circle. During the game, every 2nd child is removed from circle, until there are no children left. Task: process q queries of the form: “when there are n children, who is the k th child that will be removed?”

- **Input.** The 1st input line has an integer q : the number of queries. After this, there are q lines that describe the queries. Each line has 2 integers n, k : the number of children & the position of the child.
- **Output.** Print q integers: the answer for each query.

Note 1. It seems to me that Jack97 (nickname: abortion_grandmaster) (?) proposed this problem.

Solution. C++:

1. VNTA's C++: Josephus Queries:

```
1  #include <bits/stdc++.h>
2  using namespace std;
3
4  long long solve(long long n, long long k) {
5      if (n == 3 && k == 2) return 1;
6      if (n == 1) return 1;
7      if (k <= n / 2) return (2 * k);
8      long long new_n = n / 2;
9      long long new_k = k - (n + 1) / 2;
10     long long res = solve(new_n, new_k);
11     if (n % 2 == 0) return 2 * res - 1;
12     else return 2 * res + 1;
13 }
14
15 int main() {
16     ios_base::sync_with_stdio(false);
17     cin.tie(0); cout.tie(0);
18     int q;
19     cin >> q;
20     long long n, k;
21     while (q--) {
22         cin >> n >> k;
23         cout << solve(n, k) << "\n";
24     }
25 }
```

2. NLDK's C++: Josephus Queries:

```
1  #include<bits/stdc++.h>
2  #pragma GCC optimize ("O3")
3  #pragma GCC optimize ("unroll-loops")
4  #define Sanic_speed ios_base::sync_with_stdio(false);cin.tie(NULL);cout.tie(NULL);
```

```

5  #define Ret return 0;
6  #define ret return;
7  #define all(x) x.begin(), x.end()
8  #define el "\n";
9  #define elif else if
10 #define ll long long
11 #define fi first
12 #define se second
13 #define pb push_back
14 #define pops pop_back
15 #define cYES cout << "YES" << "\n";
16 #define cNO cout << "NO" << "\n";
17 #define cYes cout << "Yes" << "\n";
18 #define cNo cout << "No" << "\n";
19 #define frs(i, a, b) for(int i = a; i < b; ++i)
20 #define fre(i, a, b) for(int i = a; i <= b; ++i)
21 #define wh(t) while (t--)
22 #define SORAI int main()
23 using namespace std;
24 typedef unsigned long long ull;
25
26 int Looping(int n, int k) {
27     if (n == 1) {return 1;}
28     if ((n + 1) / k >= 2) {
29         if (k * 2 > n) {return 2 * k % n;}
30         else {return 2 * k;}
31     }
32     int temp = Looping(n / 2, k - (n + 1) / 2);
33     if (n & 1) {return 2 * temp + 1;}
34     else {return 2 * temp - 1;}
35 }
36
37 void solve() {
38     int n, k;
39     cin >> n >> k;
40     cout << Looping(n, k) << el
41 }
42
43 SORAI {
44     Sanic_speed
45     int t; cin >> t;
46     wh(t) {solve();}
47 }

```

3. NHT's C++: Josephus Queries:

```

1  #include <bits/stdc++.h>
2  #define ll long long
3  using namespace std;
4
5  ll fix(ll n, ll k) {
6      if (n == 1) return 1;
7      if (k <= ((n + 1) / 2)) {
8          if (2 * k > n) return (2 * k) % n;
9          else return 2 * k;
10     }
11     ll tmp = fix(n / 2, k - (n + 1) / 2);
12     if (n % 2 == 1) return 2 * tmp + 1;
13     else return 2 * tmp - 1;
14 }

```

```

15
16 int main() {
17     ios::sync_with_stdio(0);
18     cin.tie(0);
19     int q;
20     cin >> q;
21     while (q--) {
22         ll n, k;
23         cin >> n >> k;
24         cout << fix(n, k) << "\n";
25     }
26     return 0;
27 }

```

Problem 150 (CSES Problem Set/sum of divisors). Let $\sigma(n)$ denote the sum of divisors of an integer $n \in \mathbb{N}^*$, e.g., $\sigma(12) = 1 + 2 + 3 + 4 + 6 + 12 = 28$. Calculate the sum $\sum_{i=1}^n \sigma(i) \bmod 10^9 + 7$.

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print $\sum_{i=1}^n \sigma(i) \bmod 10^9 + 7$.

Constraints. $n \in [10^{12}]$.

Sample.

sum_divisor.inp	sum_divisor.out
5	21

Problem 151 (CSES Problem Set/divisor analysis). Given an integer, find the number, sum, & product of its divisors, e.g., consider the number 12:

- the number of divisors is 6 (they are 1, 2, 3, 4, 6, 12)
- the sum of divisors is $1 + 2 + 3 + 4 + 6 + 12 = 28$
- the product of divisors is $1 \cdot 2 \cdot 3 \cdot 4 \cdot 6 \cdot 12 = 1728$.

Since the input number may be large, it is given as a prime factorization.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of parts in the prime factorization. After this, there are n lines that describe the factorization. Each line has 2 integers $x, k \in \mathbb{N}^*$ where x is a prime & k is its power.

Output. Print 3 integers modulo $10^9 + 7$: the number, sum, & product of the divisors.

Constraints. $n \in [10^5], x \in \overline{2, 10^6}, k \in [10^9]$, each x is a distinct prime.

Sample.

Problem 157 (CSES Problem Set/distributing apples). There are $n \in \mathbb{N}^*$ children & $m \in \mathbb{N}^*$ apples that will be distributed to them. Count the number of ways this can be done. E.g., if $n = 3, m = 2$, there are 6 ways: $[0, 0, 2], [0, 1, 1], [0, 2, 0], [1, 0, 1], [1, 1, 0], [2, 0, 0]$.

Input. The only input line has 2 integers $n, m \in \mathbb{N}^*$.

Output. Print the number of ways modulo $10^9 + 7$.

Constraints. $m, n \in [10^6]$.

Sample.

distributing_apple.inp	distributing_apple.out

Problem 158 (CSES Problem Set/Christmas party). There are $n \in \mathbb{N}^*$ children at a Christmas party, & each of them has brought a gift. The idea is that everybody will get a gift brought by someone else. In how many ways can the gifts be distributed?

Input. The only input line has an integer $n \in \mathbb{N}^*$: the number of children.

Output. Print the number of ways modulo $10^9 + 7$.

Constraints. $n \in [10^6]$.

Sample.

Christmas_party.inp	Christmas_party.out
4	9

Problem 159 (CSES Problem Set/permutation order). Let $p(n, k)$ denote the k th permutation (in lexicographical order) of $[n]$, e.g., $p(4, 1) = [1, 2, 3, 4], p(4, 2) = [1, 2, 4, 3]$. Process 2 types of tests:

1. Given n, k , find $p(n, k)$

2. Given $n, p(n, k)$, find k .

Input. The 1st input line has an integer $t \in \mathbb{N}^*$: the number of tests. Each test is either “1 n k ” or “2 n $p(n, k)$ ”.

Output. For each test, print the answer according to the example.

Constraints. $t \in [10^3], n \in [20], k \in [n!]$.

Sample.

Problem 160 (CSES Problem Set/permutation rounds). There is a sorted array $[1, 2, \dots, n]$ & a permutation p_1, p_2, \dots, p_n . On each round, all elements move according to the permutation: the element at position i moves to position p_i . After how many rounds is the array sorted again for the 1st time?

Input. The 1st input line has an integer $n \in \mathbb{N}^*$. The next line contains n integers p_1, p_2, \dots, p_n .

Output. Print the number of rounds modulo $10^9 + 7$.

Constraints. $n \in [2 \cdot 10^5]$.

Sample.

permutation_round.inp	permutation_round.out
8	4
5 3 2 6 4 1 8 7	

Problem 161 (CSES Problem Set/bracket sequences I). Calculate the number of valid bracket sequences of length $n \in \mathbb{N}^*$, e.g., when $n = 6$, there are 5 sequences: $()()(), ()(()), (())(), ((())), ((())())$.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$.

Output. Print the number of rounds modulo $10^9 + 7$.

Constraints. $n \in [10^6]$.

Sample.

bracket_sequence_I.inp	bracket_sequence_I.out
6	5

Problem 162 (CSES Problem Set/bracket sequences II). Calculate the number of valid bracket sequences of length $n \in \mathbb{N}^*$ when a prefix of the sequence is given.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$. The 2nd line has a string of $k \in \mathbb{N}^*$ characters: the prefix of the sequence.

Output. Print the number of rounds modulo $10^9 + 7$.

Constraints. $1 \leq k \leq n \leq 10^6$.

Sample.

bracket_sequence_II.inp	bracket_sequence_II.out
6 ((()	2

Explanation. There are 2 possible sequences: $((()))()$, $((()())$.

Problem 163 (CSES Problem Set/counting necklaces). Count the number of different necklaces that consist of $n \in \mathbb{N}^*$ pearls & each pearl has $m \in \mathbb{N}^*$ possible colors. 2 necklaces are considered to be different if it is not possible to rotate 1 of them so that they look the same.

Input. The only input line has 2 integers $n, m \in \mathbb{N}^*$: the number of pearls & colors.

Output. Print 1 integer: the number of different necklaces modulo $10^9 + 7$.

Constraints. $m, n \in [10^6]$.

Sample.

count_necklace.inp	count_necklace.out
4 3	24

Problem 164 (CSES Problem Set/couting grids). Count the number of different $n \times n$ grids whose each square is black or white. 2 grids are considered to be different if it is not possible to rotate one of them so that they look the same.

Input. The only input line has an integer $n \in \mathbb{N}^*$: the size of the grid.

Output. Print 1 integer: the number of grids modulo $10^9 + 7$.

Constraints. $n \in [10^9]$.

Sample.

count_grid.inp	count_grid.out
4	16456

Problem 165 (CSES Problem Set/Fibonacci numbers). The Fibonacci numbers can be defined as follows: $F_0 = F_1 = 1$, $F_n = F_{n-1} + F_{n-2}$. Calculate the value of F_n for a given $n \in \mathbb{N}^*$.

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print the value of $F_n \bmod 10^9 + 7$.

Constraints. $n \in \overline{0, 10^{18}}$.

Sample.

Fibonacci_number.inp	Fibonacci_number.out
10	55

Problem 166 (CSES Problem Set/throwing dice). Calculate the number of ways to get a sum $n \in \mathbb{N}^*$ by throwing dice. Each throw yields an integer $\in [6]$, e.g., if $n = 10$, some possible ways are $3 + 3 + 4, 1 + 4 + 1 + 4, 1 + 1 + 6 + 1 + 1$.

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print the value of $F_n \bmod 10^9 + 7$.

Constraints. $n \in [10^{18}]$.

Sample.

throw_dice.inp	throw_dice.out
8	125

Problem 167 (CSES Problem Set/graph paths I). Consider a directed graph that has $n \in \mathbb{N}^*$ nodes & $m \in \mathbb{N}^*$ edges. Count the number of paths from node 1 to node n with exactly k edges.

Input. The 1st input line has 3 integers $n, m, k \in \mathbb{N}^*$: the number of nodes & edges, & the length of the path. The nodes are numbered $1, 2, \dots, n$. Then, there are m lines describing the edges. Each line contains 2 integers $a, b \in \mathbb{N}^*$: there is an edge from node a to node b .

Output. Print the value of $F_n \bmod 10^9 + 7$.

Constraints. $n \in [100], m \in [n(n-1)], k \in [10^9], 1 \leq a \leq b \leq n$.

Sample.

graph_path_I.inp	graph_path_I.out
3 4 8 1 2 2 3 3 1 3 2	2

Explanation. The paths are $1 \rightarrow 2 \rightarrow 3 \rightarrow 1 \rightarrow 2 \rightarrow 3 \rightarrow 1 \rightarrow 2 \rightarrow 3$ & $1 \rightarrow 2 \rightarrow 3 \rightarrow 2 \rightarrow 3 \rightarrow 2 \rightarrow 3 \rightarrow 2 \rightarrow 3$.

Problem 168 (CSES Problem Set/graph paths II). Consider a directed weighted graph having $n \in \mathbb{N}^*$ nodes & $m \in \mathbb{N}^*$ edges. Calculate the minimum path length from node 1 to node n with exactly $k \in \mathbb{N}^*$ edges.

Input. The 1st input line has 3 integers $n, m, k \in \mathbb{N}^*$: the number of nodes & edges, & the length of the path. The nodes are numbered $1, 2, \dots, n$. Then, there are m lines describing the edges. Each line contains 3 integers $a, b, c \in \mathbb{N}^*$: there is an edge from node a to node b with weight c .

Output. Print the minimum path length. If there are no such paths, print -1 .

Constraints. $n \in [100], m \in [n(n-1)], c, k \in [10^9], a, b \in [n]$.

Sample.

Problem 169 (CSES Problem Set/system of linear equations). Given $n(m+1)$ coefficients a_{ij}, b_i which form the following $n \in \mathbb{N}^*$ linear equations:

$$\begin{cases} a_{11}x_1 + a_{12}x_2 + \dots + a_{1m}x_m = b_1 \bmod 10^9 + 7, \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2m}x_m = b_2 \bmod 10^9 + 7, \\ \dots \\ a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nm}x_m = b_n \bmod 10^9 + 7. \end{cases}$$

Find any m integers x_1, x_2, \dots, x_m that satisfy the given equations.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of equations & variables. The next n lines each have $m+1$ integers $a_{i1}, a_{i2}, \dots, a_{im}, b_i$: the coefficients of the i th equation.

Output. Print m integers x_1, x_2, \dots, x_m : the values of the variables that satisfy the equations. The values must also satisfy $0 \leq x_i < 10^9 + 7$. You can print any valid solution. If no solution exists print only -1 .

Constraints. $m, n \in [500], a_{ij}, b_i \in [0, 10^9 + 6]$.

Problem 171 (CSES Problem Set/triangle number sums). A triangle number is a positive integer of the form $\sum_{i=1}^n i = \frac{n(n+1)}{2}$. The 1st triangle numbers are 1, 3, 6, 10, 15. Every positive integer can be represented as a sum of triangle numbers, e.g., $42 = 21 + 21$ & $1337 = 1326 + 10 + 1$. Given $n \in \mathbb{N}$, determine the smallest number of triangle numbers that sum to n .

Input. The 1st input line has an integer $t \in \mathbb{N}^*$: the number of test cases. After that, each line has a positive integer $n \in \mathbb{N}$.

Output. For each test, print the smallest number of triangle numbers.

Constraints. $t \in [100], n \in [10^{12}]$.

Hình học tính toán (computational geometry) là 1 nhánh của ngành khoa học máy tính (Computer Science), chuyên nghiên cứu về thuật toán giải quyết các bài toán liên quan tới các đối tượng hình học (geometrical object). Trong Toán học & công nghệ hiện đại, hình học tính toán có ứng dụng khá rộng rãi trong các lĩnh vực về đồ họa máy tính, thiết kế, mô phỏng, etc.

15.1.1 Cartesian coordinate system – Hệ tọa độ Descartes

Resources – Tài nguyên.

1. [Wikipedia/Cartesian coordinate system](#).

In geometry, a *Cartesian coordinate system* in a **plane** is a **coordinate system** that specifies each **point** uniquely by a pair of real numbers called *coordinates*, which are the signed distances to the point from 2 fixed perpendicular oriented lines, called *coordinate lines*, *coordinate axes* or just *axes* (plural of axis) of the system. The point where the axes meet is called the *origin* & has (0, 0) as coordinates. The axes directions represent an orthogonal basis. The combination of origin & basis forms a coordinate frame called the *Cartesian frame*.

– Trong hình học, 1 *hệ tọa độ Descartes* trong 1 mặt phẳng là 1 hệ tọa độ chỉ định mỗi điểm duy nhất bởi 1 cặp số thực gọi là *tọa độ*, là khoảng cách có dấu đến điểm từ 2 đường thẳng cố định vuông góc với nhau, được gọi là *đường tọa độ*, *trục tọa độ* hoặc chỉ là *trục* (số nhiều của trục) của hệ thống. Điểm mà các trục gặp nhau được gọi là *gốc* & có (0, 0) làm tọa độ. Các hướng của trục biểu diễn 1 cơ sở trục giao. Sự kết hợp của gốc & cơ sở tạo thành 1 khung tọa độ được gọi là *khung Descartes*.

Similarly, the position of any point in 3D space can be specified by 3 *Cartesian coordinates*, which are the signed distances from the point to 3 mutually perpendicular planes. More generally, n Cartesian coordinates specify the point in an n -dimensional Euclidean space for any dimension n . These coordinates are the signed distances from the point to n mutually perpendicular fixed hyperplanes.

– Tương tự như vậy, vị trí của bất kỳ điểm nào trong không gian 3 chiều có thể được chỉ định bởi 3 *tọa độ Descartes*, là khoảng cách có dấu từ điểm đến 3 mặt phẳng vuông góc với nhau. Tổng quát hơn, n tọa độ Descartes chỉ định điểm trong không

gian Euclidean n chiều cho bất kỳ chiều n nào. Các tọa độ này là khoảng cách có dấu từ điểm đến n siêu phẳng cố định vuông góc với nhau.

Cartesian coordinates are named for RENÉ DESCARTES, whose invention of them in the 17th century revolutionized mathematics by allowing the expression of problems of geometry in terms of algebra & calculus. Using the Cartesian coordinate system, geometric shapes (e.g. curves) can be described by equations involving the coordinates of points of the shape. E.g., a circle of radius 2, centered at the origin of the plane, may be described as the set of all points whose coordinates x, y satisfy the equation $x^2 + y^2 = 4$; the area, the perimeter, & the tangent line at any point can be computed from this equation by using integrals & derivatives, in a way that can be applied to any curve.

– Tọa độ Descartes được đặt theo tên của RENÉ DESCARTES, người đã phát minh ra chúng vào thế kỷ 17 đã cách mạng hóa toán học bằng cách cho phép biểu diễn các bài toán hình học theo đại số & phép tính. Sử dụng hệ tọa độ Descartes, các hình dạng hình học (ví dụ: đường cong) có thể được mô tả bằng các phương trình liên quan đến tọa độ của các điểm của hình dạng đó. Ví dụ, 1 đường tròn bán kính 2, có tâm tại gốc của mặt phẳng, có thể được mô tả là tập hợp tất cả các điểm có tọa độ x, y thỏa mãn phương trình $x^2 + y^2 = 4$; diện tích, chu vi, & đường tiếp tuyến tại bất kỳ điểm nào có thể được tính toán từ phương trình này bằng cách sử dụng tích phân & đạo hàm, theo cách có thể áp dụng cho bất kỳ đường cong nào.

Cartesian coordinates are the foundation of analytic geometry, & provide enlightening geometric interpretations for many other branches of mathematics, e.g. linear algebra, complex analysis, differential geometry, multivariate calculus, group theory, & more. A familiar example is the concept of the graph of a function. Cartesian coordinates are also essential tools for most applied disciplines that deal with geometry, including astronomy, physics, engineering, & many more. They are the most common coordinate system used in computer graphics, computer-aided geometric design, & other geometry-related data processing.

– Tọa độ Descartes là nền tảng của hình học giải tích, & cung cấp các diễn giải hình học bổ ích cho nhiều nhánh toán học khác, ví dụ như đại số tuyến tính, phân tích phức, hình học vi phân, phép tính đa biến, lý thuyết nhóm, & nhiều hơn nữa. Một ví dụ quen thuộc là khái niệm đồ thị của 1 hàm. Tọa độ Descartes cũng là công cụ thiết yếu cho hầu hết các ngành ứng dụng liên quan đến hình học, bao gồm thiên văn học, vật lý, kỹ thuật, & nhiều hơn nữa. Chúng là hệ tọa độ phổ biến nhất được sử dụng trong đồ họa máy tính, thiết kế hình học hỗ trợ máy tính, & xử lý dữ liệu liên quan đến hình học khác.

15.1.1.1 History of Cartesian coordinate system

The adjective *Cartesian* refers to the French mathematician & philosopher RENÉ DESCARTES, who published this idea in 1637 while he was resident in the Netherlands. It was independently discovered by PIERRE DE FERMAT, who also worked in 3D, although FERMAT did not publish the discovery. The French cleric NICOLE ORESME used constructions similar to Cartesian coordinates well before the time of DESCARTES & FERMAT.

– Tính từ *Cartesian* ám chỉ nhà toán học & triết gia người Pháp RENÉ DESCARTES, người đã công bố ý tưởng này vào năm 1637 khi ông đang cư trú tại Hà Lan. Nó được phát hiện độc lập bởi PIERRE DE FERMAT, người cũng làm việc trong không gian 3 chiều, mặc dù FERMAT không công bố khám phá này. Giáo sĩ người Pháp NICOLE ORESME đã sử dụng các cấu trúc tương tự như tọa độ Descartes từ rất lâu trước thời của DESCARTES & FERMAT.

Both DESCARTES & FERMAT used a single axis in their treatments & have a variable length measured in reference to this axis. The concept of using a pair of axes was introduced later, after DESCARTES' *La Géométrie* was translated into Latin in 1649 by FRANS VAN SCHOOTEN & his students. These commentators introduced several concepts while trying to clarify the ideas contained in DESCARTES's work.

– Cả DESCARTES & FERMAT đều sử dụng 1 trục duy nhất trong các phương pháp xử lý của họ & có chiều dài biến đổi được đo theo trục này. Khái niệm sử dụng 1 cặp trục được giới thiệu sau đó, sau khi DESCARTES' *La Géométrie* được dịch sang tiếng Latin vào năm 1649 bởi FRANS VAN SCHOOTEN & các học trò của ông. Những nhà bình luận này đã giới thiệu 1 số khái niệm trong khi cố gắng làm rõ các ý tưởng có trong tác phẩm của DESCARTES.

The development of the Cartesian coordinate system would play a fundamental role in the development of the calculus by ISAAC NEWTON & GOTTFRIED WILHELM LEIBNIZ. The 2-coordinate description of the plane was later generalized into the concept of vector spaces.

– Sự phát triển của hệ tọa độ Descartes sẽ đóng vai trò cơ bản trong sự phát triển phép tính của ISAAC NEWTON & GOTTFRIED WILHELM LEIBNIZ. Mô tả 2 tọa độ của mặt phẳng sau đó được khái quát thành khái niệm không gian vectơ.

Many other coordinate systems have been developed since DESCARTES, e.g. the polar coordinates for the plane, & the spherical & cylindrical coordinates for 3D space.

– Nhiều hệ tọa độ khác đã được phát triển kể từ thời DESCARTES, e.g., tọa độ cực cho mặt phẳng, & tọa độ hình cầu & tọa độ hình trụ cho không gian 3D.

15.1.1.2 Cartesian formulae for the plane – Công thức Descartes cho mặt phẳng

15.1.1.2.1 Distance between 2 points – Khoảng cách giữa 2 điểm. The **Euclidean distance** between 2 points of the plane with Cartesian coordinates $A_1(x_1, y_1), A_2(x_2, y_2) \in \mathbb{R}^2$ is $d(A_1, A_2) = d((x_1, y_1), (x_2, y_2)) := \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$. This is the Cartesian version of **Pythagoras's theorem**. In 3D space, the distance between points $A_1(x_1, y_1, z_1), A_2(x_2, y_2, z_2) \in \mathbb{R}^3$ is $d(A_1, A_2) = d((x_1, y_1, z_1), (x_2, y_2, z_2)) := \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$, which can be obtained by 2 consecutive application of Pythagoras's theorem.

15.1.1.2.2 Euclidean transformations – Các phép biến đổi Euclidean. The *Euclidean transformations* or *Euclidean motions* are the (bijective) mappings of points of the *Euclidean plane* to themselves which preserve distances between points. There are 4 types of these mappings (also called *isometries*): **translations**, **rotations**, **reflections**, & **glide reflections**.

– *Phép biến đổi Euclidean* hoặc *Chuyển động Euclidean* là phép ánh xạ (song ánh) của các điểm trên mặt phẳng Euclidean với chính chúng, phép ánh xạ này bảo toàn khoảng cách giữa các điểm. Có 4 loại phép ánh xạ này (còn gọi là *đẳng cự*): phép tịnh tiến, phép quay, phép phản xạ, & phản xạ trượt.

1. **Translation – Phép tịnh tiến.** **Translating** a set of points of the plane, preserving the distances & directions between them, is equivalent to adding a fixed pair of numbers (a, b) to the Cartesian coordinates of every point in the set. I.e., if the original coordinates of a point are (x, y) , after the translation they will be $(x', y') = (x + a, y + b)$.
– Việc tịnh tiến 1 tập hợp các điểm của mặt phẳng, bảo toàn khoảng cách & hướng giữa chúng, tương đương với việc thêm 1 cặp số cố định (a, b) vào tọa độ Descartes của mọi điểm trong tập hợp. Tức là, nếu tọa độ ban đầu của 1 điểm là (x, y) , sau khi tịnh tiến, chúng sẽ là $(x', y') = (x + a, y + b)$.
2. **Rotation – Phép quay.** To rotate a figure counterclockwise around the origin by some angle θ is equivalent to replacing every point with coordinates (x, y) by the point with coordinates (x', y') , where $x' = x \cos \theta - y \sin \theta$, $y' = x \sin \theta + y \cos \theta$.
– Để quay 1 hình ngược chiều kim đồng hồ quanh gốc tọa độ θ tương đương với việc thay thế mọi điểm có tọa độ (x, y) bằng điểm có tọa độ (x', y') , trong đó $x' = x \cos \theta - y \sin \theta$, $y' = x \sin \theta + y \cos \theta$. Thus $(x', y') = (x \cos \theta - y \sin \theta, x \sin \theta + y \cos \theta)$.
3. **Reflection – Phép phản xạ.** If (x, y) are the Cartesian coordinates of a point, then $(-x, y)$ are the coordinates of its reflection across the 2nd coordinate axis (the y -axis), as if that line were a mirror. Likewise, $(x, -y)$ are the coordinates of its reflection across the 1st coordinate axis (the x -axis). In more generality, reflection across a line through the origin making an angle θ with the x -axis, is equivalent to replacing every point with coordinates (x, y) by the point with coordinates $(x', y') = (x \cos 2\theta + y \sin 2\theta, x \sin 2\theta - y \cos 2\theta)$.
– Nếu (x, y) là tọa độ Descartes của 1 điểm, thì $(-x, y)$ là tọa độ của phép phản chiếu của nó qua trục tọa độ thứ 2 (trục y), như thể đường thẳng đó là 1 tấm gương. Tương tự như vậy, $(x, -y)$ là tọa độ của phép phản chiếu của nó qua trục tọa độ thứ nhất (trục x). Nói chung hơn, phép phản chiếu qua 1 đường thẳng đi qua gốc tọa độ tạo thành 1 góc θ với trục x , tương đương với việc thay thế mọi điểm có tọa độ (x, y) bằng điểm có tọa độ $(x', y') = (x \cos 2\theta + y \sin 2\theta, x \sin 2\theta - y \cos 2\theta)$.
4. **Glide reflection – Phản xạ trượt.** A glide reflection is the composition of a reflection across a line followed by a translation in the direction of that line. It can be seen that the order of these operations does not matter (the translation can come 1st, followed by the reflection).
– Phản xạ trượt là sự kết hợp của phản xạ qua 1 đường thẳng theo sau là phép tịnh tiến theo hướng của đường thẳng đó. Có thể thấy rằng thứ tự của các phép toán này không quan trọng (phép tịnh tiến có thể đứng thứ nhất, sau đó là phép phản xạ).
5. **General matrix form of the transformations – Dạng ma trận tổng quát của các phép biến đổi.** All affine transformations of the plane can be described in a uniform way by using matrices. For this purpose, the coordinates (x, y) of a point are commonly represented as the column matrix $\begin{pmatrix} x \\ y \end{pmatrix}$. The result (x', y') of applying an affine transformation to a point (x, y) is given by the formula

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = A \begin{pmatrix} x \\ y \end{pmatrix} + b \text{ where } A = \begin{pmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{pmatrix} \in M_2, \quad b = \begin{pmatrix} b_1 \\ b_2 \end{pmatrix}.$$

I.e.,

$$x' = xA_{11} + yA_{12} + b_1, \quad y' = xA_{21} + yA_{22} + b_2.$$

Among the affine transformations, the Euclidean transformations are characterized by the fact that the matrix A is orthogonal, i.e., its columns are orthogonal vectors of Euclidean norm 1, or explicitly,

$$A_{11}A_{12} + A_{21}A_{22} = 0, \quad A_{11}^2 + A_{21}^2 = A_{12}^2 + A_{22}^2 = 1 \Leftrightarrow AA^T = I.$$

If these conditions do not hold, the formula describes a more general affine transformation.

Theorem 2. (a) The transformation is a translation iff $A = I$. The transformation is a rotation around some point iff A is a *rotation matrix*, i.e., it is orthogonal & $A_{11}A_{22} - A_{21}A_{12} = 1$. A reflection or glide reflection is obtained when $A_{11}A_{22} - A_{21}A_{12} = -1$. (b) Assuming that translations are not used, i.e., $b_1 = b_2 = 0$, transformations can be composed by simply multiplying the associated transformation matrices. In the general case, it is useful to use the augmented matrix of the transformations, i.e., to rewrite the transformation formula

$$\begin{pmatrix} x' \\ y' \\ 1 \end{pmatrix} = A' \begin{pmatrix} x \\ y \\ 1 \end{pmatrix} \text{ where } A' = \begin{pmatrix} A_{11} & A_{12} & b_1 \\ A_{21} & A_{22} & b_2 \\ 0 & 0 & 1 \end{pmatrix}.$$

With this trick, the composition of affine transformations is obtained by multiplying the augmented matrices.

15.1.1.2.3 Affine transformation – Phép biến hình affine. Affine transformations of the Euclidean plane are transformations that map lines to lines, but may change distances & angles. They can be represented with augmented matrices:

$$\begin{pmatrix} A_{11} & A_{21} & b_1 \\ A_{12} & A_{22} & b_2 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ 1 \end{pmatrix} = \begin{pmatrix} x' \\ y' \\ 1 \end{pmatrix}.$$

The Euclidean transformations are the affine transformations s.t. the 2×2 matrix of the A_{ij} is orthogonal.

– Phép biến đổi afin của mặt phẳng Euclid là phép biến đổi ánh xạ các đường thẳng thành các đường thẳng, nhưng có thể thay đổi khoảng cách & góc. Chúng có thể được biểu diễn bằng các ma trận tăng cường:

$$\begin{pmatrix} A_{11} & A_{21} & b_1 \\ A_{12} & A_{22} & b_2 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ 1 \end{pmatrix} = \begin{pmatrix} x' \\ y' \\ 1 \end{pmatrix}.$$

Phép biến đổi Euclid là phép biến đổi afin vì ma trận 2×2 của A_{ij} là trực giao.

The augmented matrix that represents the composition of 2 affine transformations is obtained by multiplying their augmented matrices. Some affine transformations that are not Euclidean transformations have received specific names.

– Ma trận tăng cường biểu diễn thành phần của 2 phép biến đổi afin thu được bằng cách nhân các ma trận tăng cường của chúng. Một số phép biến đổi afin không phải là phép biến đổi Euclid đã nhận được tên gọi cụ thể.

- **Scaling – Tỷ lệ.** An example of an affine transformation which is not Euclidean is given by scaling. To make a figure larger or smaller is equivalent to multiplying the Cartesian coordinates of every point by the same positive number $m \in (0, \infty)$. If (x, y) are the coordinates of a point on the original figure, the corresponding point on the scaled figure has coordinates $(x', y') = (mx, my)$. If $m > 1$, the figure becomes larger; if $m \in (0, 1)$, it becomes smaller.
 - 1 ví dụ về phép biến đổi afin không phải Euclidean được đưa ra bằng cách chia tỷ lệ. Để làm cho 1 hình lớn hơn hoặc nhỏ hơn tương đương với việc nhân tọa độ Descartes của mọi điểm với cùng 1 số dương $m \in (0, \infty)$. Nếu (x, y) là tọa độ của 1 điểm trên hình gốc, thì điểm tương ứng trên hình đã chia tỷ lệ có tọa độ $(x', y') = (mx, my)$. Nếu $m > 1$, hình trở nên lớn hơn; nếu $m \in (0, 1)$, nó trở nên nhỏ hơn.
- **Shearing – Cắt.** A shearing transformation will push the top of a square sideways to form a parallelogram. Horizontal shearing is defined by $(x', y') = (x + sy, y)$. Shearing can also be applied vertically: $(x', y') = (x, sx + y)$.
 - Phép biến đổi cắt sẽ đẩy đỉnh của hình vuông sang 1 bên để tạo thành hình bình hành. Cắt ngang được định nghĩa bởi $(x', y') = (x + sy, y)$. Cắt cũng có thể được áp dụng theo chiều dọc: $(x', y') = (x, sx + y)$.

15.1.1.3 Orientation & handedness ★ – Định hướng & thuận tay ★

15.2 Shoelace formula – Công thức dây giày

Resources – Tài nguyên.

1. [Wikipedia/shoelace formula](#).

The *shoelace formula*, also known as *Gauss's area formula* & the *surveyor's formula*, is a mathematical algorithm to determine the area of a **simple polygon** whose vertices are described by their Cartesian coordinates in the plane. It is called the shoelace formula because of the constant cross-multiplying for the coordinates making up the polygon, like threading shoelaces. It has applications in surveying & forestry, among other areas.

– *công thức dây giày*, còn được gọi là *công thức diện tích Gauss* & *công thức của người khảo sát*, là 1 thuật toán toán học để xác định diện tích của 1 đa giác đơn giản có các đỉnh được mô tả bằng tọa độ Descartes của chúng trên mặt phẳng. Nó được gọi là công thức dây giày vì phép nhân chéo không đối đối với các tọa độ tạo nên đa giác, giống như việc xoắn dây giày. Nó có ứng dụng trong khảo sát & lâm nghiệp, trong số các lĩnh vực khác.

The formula was described by ALBRECHT LUDWIG FRIEDRICH MEISTER (1724–1788) in 1769 & is based on the trapezoidal formula which was described by CARL FRIEDRICH GAUSS & C.G.J. JACOBI. The triangle form of the area formula can be considered to be a special case of **Green's theorem**.

– Công thức này được ALBRECHT LUDWIG FRIEDRICH MEISTER (1724–1788) mô tả vào năm 1769 & dựa trên công thức hình thang được CARL FRIEDRICH GAUSS mô tả & C.G.J. JACOBI. Dạng tam giác của công thức diện tích có thể được coi là 1 trường hợp đặc biệt của định lý Green.

The area formula can also be applied to self-overlapping polygons since the meaning of area is still clear even though self-overlapping polygons are not generally simple. Furthermore, a self-overlapping polygon can have multiple “interpretations” but the Shoelace formula can be used to show that the polygon's area is the same regardless of the interpretation.

– Công thức diện tích cũng có thể được áp dụng cho các đa giác tự chồng lên nhau vì ý nghĩa của diện tích vẫn rõ ràng mặc dù các đa giác tự chồng lên nhau thường không đơn giản. Hơn nữa, 1 đa giác tự chồng lên nhau có thể có nhiều “cách diễn giải” nhưng công thức Shoelace có thể được sử dụng để chỉ ra rằng diện tích của đa giác là như nhau bất kể cách diễn giải nào.

15.2.1 Polygon area formulas – Công thức diện tích đa giác

Basic idea. Any polygon edge determines the *signed* area of a trapezoid. All these areas sum up to the polygon area.

– Ý tưởng cơ bản. Bất kỳ cạnh đa giác nào cũng xác định diện tích *có dấu* của hình thang. Tất cả các diện tích này cộng lại thành diện tích đa giác.

Given. A planar simple polygon with a *positively oriented* (counter clock wise) sequence of points $P_i = (x_i, y_i)$, $\forall i \in [n]$ in a Cartesian coordinate system. For the simplicity of the formulas below it is convenient to set $P_0 = P_n, P_{n+1} = P_1$.

– Cho: 1 đa giác phẳng đơn giản với 1 chuỗi *hướng dương* (ngược chiều kim đồng hồ) các điểm $P_i = (x_i, y_i)$, $\forall i \in [n]$ trong hệ tọa độ Descartes. Để đơn giản hóa các công thức bên dưới, thuận tiện hơn là đặt $P_0 = P_n, P_{n+1} = P_1$.

Formulas. The area of the given polygon can be expressed by a variety of formulas, which are connected by simple operations. If the polygon is *negatively oriented*, then the result A of the formulas is negative. In any case $|A|$ is the sought area of the polygon.

– Công thức. Diện tích của đa giác cho trước có thể được biểu thị bằng nhiều công thức khác nhau, được kết nối bằng các phép toán đơn giản. Nếu đa giác *có hướng âm*, thì kết quả A của các công thức là âm. Trong mọi trường hợp $|A|$ là diện tích cần tìm của đa giác.

15.2.1.1 Trapezoid formula – Công thức hình thang

The trapezoid formula sums up a sequence of oriented areas $A_i = \frac{1}{2}(y_i + y_{i+1})(x_i - x_{i+1})$ of trapezoids with $P_i P_{i+1}$ as 1 of its 4 edges:

$$A = \frac{1}{2} \sum_{i=1}^n (y_i + y_{i+1})(x_i - x_{i+1}) = \frac{1}{2} ((y_1 + y_2)(x_1 - x_2) + \cdots + (y_n + y_1)(x_n - x_1)).$$

Derivation of trapezoidal formula. The edge $P_i P_{i+1}$ determines the trapezoid $(x_i, y_i), (x_{i+1}, y_{i+1}), (x_i, 0), (x_{i+1}, 0)$ with its oriented area

$$A_i = \frac{1}{2}(y_i + y_{i+1})(x_i - x_{i+1}).$$

In case of $x_i < x_{i+1}$, $A_i < 0$, otherwise $A_i > 0$ or $A_i = 0$ if $x_i = x_{i+1}$. In the diagram the orientation of an edge is shown by an arrow. The color shows the sign of A_i : red means $A_i < 0$, green indicates $A_i > 0$.

Hình 15.1: Deriving the trapezoid formula. Source: Wikipediat/shoelace formula.

In the 1st case the trapezoid is called *negative* in the 2nd case *positive*. The negative trapezoids delete those parts of positive trapezoids, which are outside the polygon. In case of a convex polygon (in the diagram the upper example) this is obvious: The polygon area is the sum of the areas of the positive trapezoids (green edges) minus the areas of the negative trapezoids (red edges). In the nonconvex case one has to consider the situation more carefully. In any case the result is

$$A = \sum_{i=1}^n A_i = \frac{1}{2} \sum_{i=1}^n (y_i + y_{i+1})(x_i - x_{i+1}).$$

15.2.1.2 Triangle formula, determinant form – Công thức tam giác, dạng định thức

The triangle formula sums up the oriented areas A_i of triangles OP_iP_{i+1} :

$$A = \frac{1}{2} \sum_{i=1}^n (x_i y_{i+1} - x_{i+1} y_i) = \frac{1}{2} \sum_{i=1}^n \begin{vmatrix} x_i & x_{i+1} \\ y_i & y_{i+1} \end{vmatrix} = \frac{1}{2} \sum_{i=1}^n \begin{vmatrix} x_i & y_i \\ x_{i+1} & y_{i+1} \end{vmatrix} = \frac{1}{2} (x_1 y_2 - x_2 y_1 + x_2 y_3 - x_3 y_2 + \cdots + x_n y_1 - x_1 y_n).$$

Eliminating the brackets & using $\sum_{i=1}^n x_i y_i = \sum_{i=1}^n x_{i+1} y_{i+1}$ (convention $P_{n+1} = P_1$), one gets the *determinant form* of the area formula:

$$A = \frac{1}{2} \sum_{i=1}^n (x_i y_{i+1} - x_{i+1} y_i) = \frac{1}{2} \sum_{i=1}^n \begin{vmatrix} x_i & x_{i+1} \\ y_i & y_{i+1} \end{vmatrix}.$$

Because 1 half of the i th determinant is the oriented **area of the triangle** $\Delta OP_i P_{i+1}$ this version of the area formula is called *triangle form*.

– Công thức tam giác tổng hợp các diện tích định hướng A_i của các tam giác $OP_i P_{i+1}$:

$$A = \frac{1}{2} \sum_{i=1}^n (x_i y_{i+1} - x_{i+1} y_i) = \frac{1}{2} \sum_{i=1}^n \begin{vmatrix} x_i & x_{i+1} \\ y_i & y_{i+1} \end{vmatrix} = \frac{1}{2} \sum_{i=1}^n \begin{vmatrix} x_i & y_i \\ x_{i+1} & y_{i+1} \end{vmatrix} = \frac{1}{2} (x_1 y_2 - x_2 y_1 + x_2 y_3 - x_3 y_2 + \cdots + x_n y_1 - x_1 y_n).$$

Loại bỏ dấu ngoặc & sử dụng $\sum_{i=1}^n x_i y_i = \sum_{i=1}^n x_{i+1} y_{i+1}$ (quy ước $P_{n+1} = P_1$), ta sẽ có được *dạng định thức* của công thức diện tích:

$$A = \frac{1}{2} \sum_{i=1}^n (x_i y_{i+1} - x_{i+1} y_i) = \frac{1}{2} \sum_{i=1}^n \begin{vmatrix} x_i & x_{i+1} \\ y_i & y_{i+1} \end{vmatrix}.$$

Vì 1 nửa của định thức i là diện tích định hướng của tam giác $OP_i P_{i+1}$ nên phiên bản này của công thức diện tích được gọi là *dạng tam giác*.

15.2.1.3 Shoelace formula – Công thức dây giày

The triangle formula is the base of the popular *shoelace formula*, which is a scheme that optimizes the calculation of the sum of the 2×2 -determinants by hand:

$$2A = \begin{vmatrix} x_1 & x_2 \\ y_1 & y_2 \end{vmatrix} + \begin{vmatrix} x_2 & x_3 \\ y_2 & y_3 \end{vmatrix} + \cdots + \begin{vmatrix} x_n & x_1 \\ y_n & y_1 \end{vmatrix} = \begin{vmatrix} x_1 & x_2 & x_3 & \cdots & x_n & x_1 \\ y_1 & y_2 & y_3 & \cdots & y_n & y_1 \end{vmatrix}$$

Sometimes this determinant is transposed (written vertically, in 2 columns).

15.2.1.4 Other formulas

$$A = \frac{1}{2} \sum_{i=1}^n y_i (x_{i-1} - x_{i+1}) = \frac{1}{2} (y_1 (x_n - x_2) + y_2 (x_1 - x_3) + \cdots + y_n (x_{n-1} - x_1)) = \frac{1}{2} \sum_{i=1}^n x_i (y_{i+1} - y_{i-1}).$$

With $\sum_{i=1}^n x_i y_{i+1} = \sum_{i=1}^n x_{i-1} y_i$ (convention $P_0 = P_n, P_{n+1} = P_1$) one gets

$$2A = \sum_{i=1}^n (x_i y_{i+1} - x_{i+1} y_i) = \sum_{i=1}^n x_i y_{i+1} - \sum_{i=1}^n x_{i+1} y_i = \sum_{i=1}^n x_{i-1} y_i - \sum_{i=1}^n x_{i+1} y_i.$$

Combining both sums & excluding y_i leads to

$$A = \frac{1}{2} \sum_{i=1}^n y_i (x_{i-1} - x_{i+1}).$$

With the identity $\sum_{i=1}^n x_{i+1} y_i = \sum_{i=1}^n x_i y_{i-1}$ one gets

$$A = \frac{1}{2} \sum_{i=1}^n x_i (y_{i+1} - y_{i-1}).$$

Alternatively, this is a special case of Green's theorem with 1 function set to 0 & the other set to x , s.t. the area is the integral of $x dy$ along the boundary.

– Với $\sum_{i=1}^n x_i y_{i+1} = \sum_{i=1}^n x_{i-1} y_i$ (quy ước $P_0 = P_n, P_{n+1} = P_1$) ta có

$$2A = \sum_{i=1}^n (x_i y_{i+1} - x_{i+1} y_i) = \sum_{i=1}^n x_i y_{i+1} - \sum_{i=1}^n x_{i+1} y_i = \sum_{i=1}^n x_{i-1} y_i - \sum_{i=1}^n x_{i+1} y_i.$$

Kết hợp cả hai tổng & loại trừ y_i dẫn đến

$$A = \frac{1}{2} \sum_{i=1}^n y_i (x_{i-1} - x_{i+1}).$$

Với hằng đẳng thức $\sum_{i=1}^n x_{i+1} y_i = \sum_{i=1}^n x_i y_{i-1}$ ta có

$$A = \frac{1}{2} \sum_{i=1}^n x_i (y_{i+1} - y_{i-1}).$$

Ngoài ra, đây là trường hợp đặc biệt của định lý Green với 1 hàm được đặt thành 0 & hàm còn lại được đặt thành x , s.t. diện tích là tích phân của $x dy$ dọc theo biên.

15.2.1.5 Exterior algebra – Đại số ngoài

A particularly concise statement of the formula can be given in terms of the exterior algebra. Let $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ be the consecutive vertices of the polygon. The Cartesian coordinate expansion of the outer product w.r.t. the standard ordered orthonormal plane basis (\mathbf{x}, \mathbf{y}) gives $\mathbf{v}_i \wedge \mathbf{v}_{i+1} = (x_i y_{i+1} - x_{i+1} y_i) \mathbf{x} \wedge \mathbf{y}$ & the oriented area is given as follows:

$$A = \frac{1}{2} \sum_{i=1}^n \mathbf{v}_i \wedge \mathbf{v}_{i+1} = \frac{1}{2} \sum_{i=1}^n (x_i y_{i+1} - x_{i+1} y_i) \mathbf{x} \wedge \mathbf{y}.$$

The area is given as a multiple of the unit area $\mathbf{x} \wedge \mathbf{y}$.

– 1 phát biểu đặc biệt ngắn gọn về công thức có thể được đưa ra dưới dạng đại số ngoài. Giả sử $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ là các đỉnh liên tiếp của đa giác. Khai triển tọa độ Descartes của tích ngoài w.r.t. cơ sở mặt phẳng chuẩn trực chuẩn sắp xếp (\mathbf{x}, \mathbf{y}) cho $\mathbf{v}_i \wedge \mathbf{v}_{i+1} = (x_i y_{i+1} - x_{i+1} y_i) \mathbf{x} \wedge \mathbf{y}$ & diện tích định hướng được đưa ra như sau:

$$A = \frac{1}{2} \sum_{i=1}^n \mathbf{v}_i \wedge \mathbf{v}_{i+1} = \frac{1}{2} \sum_{i=1}^n (x_i y_{i+1} - x_{i+1} y_i) \mathbf{x} \wedge \mathbf{y}.$$

Diện tích được đưa ra dưới dạng bội số của diện tích đơn vị $\mathbf{x} \wedge \mathbf{y}$.

Bài toán 36 (Area of polygon – Diện tích đa giác). *Viết thuật toán & chương trình C/C++, Pascal, Python để tính diện tích của đa giác $n \in \mathbb{N}, n \geq 3$ đỉnh $A_1 A_2 \dots A_n$ với tọa độ n đỉnh $A_i(x_i, y_i) \in \mathbb{R}^2$ cho trước, $\forall i \in [n]$.*

Input. Dòng 1 chứa 1 số nguyên $n \in \mathbb{N}, n \geq 3$. Mỗi dòng trong n dòng tiếp theo chứa 2 số thực $x_i, y_i \in \mathbb{R}, \forall i \in [n]$.

Output. In ra 1 số thực dương là diện tích của đa giác $A_1 A_2 \dots A_n$.

15.2.2 Manipulations of a polygon – Các thao tác trên 1 đa giác

$A(P_1, \dots, P_n)$ indicates the oriented area of the simple polygon P_1, \dots, P_n with $n \in \mathbb{N}, n \geq 4$. A is positive/negative if the orientation of the polygon is positive/negative. From the triangle form of the area formula or the diagram below one observes for $i \in \overline{2, n-1}$:

$$A(P_1, \dots, P_n) = A(P_1, \dots, P_{i-1}, P_{i+1}, \dots, P_n) + A(P_{i-1}, P_i, P_{i+1}).$$

In case of $i = 1$ or $i = n$ one should 1st shift the indices. Hence:

1. Moving P_i affects only $A(P_{i-1}, P_i, P_{i+1})$ & leaves $A(P_1, \dots, P_{i-1}, P_{i+1}, \dots, P_n)$ unchanged. There is no change of the area if P_i is moved parallel to $\overline{P_{i-1} P_{i+1}}$.
2. Purging P_i changes the total area by $A(P_{i-1}, P_i, P_{i+1})$, which can be positive or negative.
3. Inserting point Q between P_i, P_{i+1} changes the total area by $A(P_i, Q, P_{i+1})$, which can be positive or negative.

– $A(P_1, \dots, P_n)$ biểu thị diện tích định hướng của đa giác đơn P_1, \dots, P_n với $n \in \mathbb{N}, n \geq 4$. A là dương/âm nếu định hướng của đa giác là dương/âm. Từ dạng tam giác của công thức diện tích hoặc sơ đồ bên dưới, người ta quan sát thấy đối với $i \in \overline{2, n-1}$:

$$A(P_1, \dots, P_n) = A(P_1, \dots, P_{i-1}, P_{i+1}, \dots, P_n) + A(P_{i-1}, P_i, P_{i+1}).$$

Trong trường hợp $i = 1$ hoặc $i = n$, trước tiên người ta phải dịch chuyển các chỉ số. Do đó:

1. Di chuyển P_i chỉ ảnh hưởng đến $A(P_{i-1}, P_i, P_{i+1})$ & giữ nguyên $A(P_1, \dots, P_{i-1}, P_{i+1}, \dots, P_n)$. Không có thay đổi nào về diện tích nếu P_i được di chuyển song song với $\overline{P_{i-1} P_{i+1}}$.
2. Xóa P_i làm thay đổi tổng diện tích theo $A(P_{i-1}, P_i, P_{i+1})$, có thể dương hoặc âm.
3. Chèn điểm Q giữa P_i, P_{i+1} làm thay đổi tổng diện tích theo $A(P_i, Q, P_{i+1})$, có thể dương hoặc âm.

15.2.3 Generalization of shoelace formula

In higher dimensions the area of a polygon can be calculated from its vertices using the exterior algebra form of the Shoelace formula (e.g., in 3D, the sum of successive **cross products**):

$$A = \frac{1}{2} \left\| \sum_{i=1}^n v_i \wedge v_{i+1} \right\|$$

(when the vertices are not **coplanar** this computes the **vector area** enclosed by the loop, i.e., the **projected area** or “shadow” in the plane in which it is greatest).

– Ở các chiều cao hơn, diện tích của 1 đa giác có thể được tính từ các đỉnh của nó bằng cách sử dụng dạng đại số ngoài của công thức Shoelace (ví dụ, trong 3D, tổng của các tích có hướng liên tiếp):

$$A = \frac{1}{2} \left\| \sum_{i=1}^n v_i \wedge v_{i+1} \right\|$$

(khi các đỉnh không đồng phẳng, công thức này sẽ tính diện tích vectơ được bao quanh bởi vòng lặp, tức là diện tích chiếu hoặc “bóng” trên mặt phẳng mà diện tích đó lớn nhất).

This formulation can also be generalized to calculate the volume of an n -dimensional polytope from the coordinates of its vertices, or more accurately, from its hypersurface mesh. E.g., the volume of a 3D polyhedron can be found by triangulating its surface mesh & summing the signed volumes of the tetrahedra formed by each surface triangle & the origin:

$$V = \frac{1}{6} \left\| \sum_F v_a \wedge v_b \wedge v_c \right\|$$

where the sum is over the faces & care has to be taken to order the vertices consistently (all clockwise or anticlockwise viewed from outside the polyhedron). Alternatively, an expression in terms of the face areas & surface normals may be derived using the divergence theorem.

– Công thức này cũng có thể được khái quát hóa để tính thể tích của 1 đa diện n chiều từ tọa độ các đỉnh của nó, hoặc chính xác hơn, từ lưới siêu bề mặt của nó. E.g., thể tích của 1 đa diện 3D có thể được tìm thấy bằng cách tam giác hóa lưới bề mặt của nó & cộng các thể tích có dấu của tứ diện được tạo thành bởi mỗi tam giác bề mặt & gốc:

$$V = \frac{1}{6} \left\| \sum_F v_a \wedge v_b \wedge v_c \right\|$$

trong đó tổng nằm trên các mặt & phải cẩn thận để sắp xếp các đỉnh 1 cách nhất quán (tất cả theo chiều kim đồng hồ hoặc ngược chiều kim đồng hồ khi nhìn từ bên ngoài đa diện). Ngoài ra, 1 biểu thức theo diện tích mặt & pháp tuyến bề mặt có thể được suy ra bằng cách sử dụng định lý phân kỳ.

15.3 Problems: Computational elementary geometry

Bài toán 37 (Bao phủ hình chữ nhật nguyên 2D nhỏ nhất). (2.5 điểm) *Viết chương trình Python để tính chu vi, diện tích, & độ dài đường chéo hình chữ nhật nhỏ nhất “chứa trọn” $n \in \mathbb{N}^*$ điểm $A_1(x_1, y_1), A_2(x_2, y_2), \dots, A_n(x_n, y_n) \in \mathbb{R}^2$ với tọa độ nguyên $x_i, y_i \in \mathbb{Z}, \forall i = 1, \dots, n$, cho trước trong mặt phẳng 2 chiều, “chứa trọn” ở đây nghĩa là các điểm chỉ được nằm bên trong hình chữ nhật, không được nằm trên cạnh hình chữ nhật.*

Input. Dòng 1 chứa số nguyên $n \in \mathbb{N}^*$: * số điểm trong mặt phẳng 2 chiều. n dòng tiếp theo, mỗi dòng chứa 2 số nguyên $x_i, y_i \in \mathbb{Z}$: hoành độ & tung độ của điểm thứ i $A_i(x_i, y_i)$.

Output. In ra chu vi, diện tích, & đường chéo của hình chữ nhật thỏa mãn nhờ gọi lại hàm của Bài 1 (hoặc tự viết lại nếu muốn).

Sample.

min_rectangle.inp	min_rectangle.out
4	$P = 26$
1 0	$S = 40$
-2 2	$d = 9.43398113206$
-1 3	
4 2	

Solution. Python:

```

1      n = int(input()) # number of 2D points -- số điểm trên mặt phẳng
2      x_min = y_min = 1e9
3      x_max = y_max = -1e9
4      for i in range(n):
5          x, y = map(int, input().split())
6          if x < x_min:
7              x_min = x
8          if x > x_max:
9              x_max = x
10         if y < y_min:
11             y_min = y
12         if y > y_max:
13             y_max = y
14         a, b = x_max - x_min + 2, y_max - y_min + 2
15         print('P =', 2 * (a + b))

Problem 184 (CSES Problem Set/polygon area). Calculate the area of a given polygon. The polygon consists of n vertices (x_i, y_i) , $\forall i \in [n]$. The vertices (x_i, y_i) & (x_{i+1}, y_{i+1}) are adjacent for $i \in [n - 1]$, & the vertices (x_1, y_1) & (x_n, y_n) are also adjacent.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of vertices. After this, there are n lines that describe the vertices. The i th such line has 2 integers $x_i, y_i \in \mathbb{Z}$. You may assume that the polygon is simple, i.e., it does not intersect itself.

Output. Print 1 integer: $2a \in \mathbb{Z}$ where the area of the polygon is a (is ensures that the result is an integer).

Constraints. $n \in \overline{3, 1000}, x_i, y_i \in \overline{-10^9, 10^9}, \forall i \in [n]$.

Sample.

polygon_area.inp	polygon_area.out

Problem 185 (CSES Problem Set/point in polygon). You are given a polygon of $n \in \mathbb{N}^*$ vertices & a list of $m \in \mathbb{N}^*$ points. Determine for each point if it is inside, outside or on the boundary of the polygon. The polygon consists of n vertices (x_i, y_i) , $\forall i \in [n]$. The vertices (x_i, y_i) & (x_{i+1}, y_{i+1}) are adjacent for $i \in [n-1]$, & the vertices (x_1, y_1) & (x_n, y_n) are also adjacent.

Input. The 1st input line has 2 integer $n, m \in \mathbb{N}^*$: the number of vertices in the polygon & the number of points. After this, there are n lines that describe the polygon. The i th such line has 2 integers x_i, y_i . You may assume that the polygon is simple, i.e., it does not intersect itself. Finally, there are m lines that describe the points. Each line has 2 integers $x, y \in \mathbb{Z}$.

Output. For each point, print INSIDE, OUTSIDE or BOUNDARY.

Constraints. $M, n \in \overline{3, 1000}, m \in [1000], x, y, x_i, y_i \in \overline{-10^9, 10^9}, \forall i \in [n]$.

Problem 190 (CSES Problem Set/all Manhattan distances). Given a set of points, calculate the sum of all Manhattan distances between 2 point pairs.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of points. The following n lines describe the points. Each line has 2 integers $x, y \in \mathbb{Z}$. You can assume that each point is distinct.

Output. Print the sum of all Manhattan distances.

Constraints. $n \in \overline{2, 2 \cdot 10^5}$, $x, y \in \overline{-10^9, 10^9}$.

Sample.

Problem 191 (CSES Problem Set/intersection points). Given $n \in \mathbb{N}^*$ horizontal & vertical line segments, calculate the number of their intersection points. You can assume that no parallel line segments intersect, & no endpoint of a line segment is an intersection point.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of line segments. Then there are n lines describing the line segments. Each line has 4 integers: x_1, y_1, x_2, y_2 : a line segment begins at point (x_1, y_1) & ends at point (x_2, y_2) .

Output. Print the number of intersection points.

Constraints. $n \in [10^5], x_1, x_2, y_1, y_2 \in \overline{-10^6, 10^6}, (x_1, y_1) \neq (x_2, y_2)$.

Problem 192 (CSES Problem Set/line segments trace I). There are $n \in \mathbb{N}^*$ line segments whose endpoints have integer coordinates. The left x -coordinate of each segment is 0 & the right x -coordinate is $m \in \mathbb{N}^*$. The slope of each segment is an integer. For each x -coordinate $0, 1, \dots, m$, find the maximum point in any line segment.

Input. The 1st input line has 2 integer $n, m \in \mathbb{N}^*$: the number of line segments & the maximum x -coordinate. The next n lines describe the line segments. Each line has 2 integers y_1, y_2 : there is a line segment between points $(0, y_1)$ & (m, y_2) .

Output. Print $m + 1$ integers: the maximum points for $x = 0, 1, \dots, m$.

Constraints. $m, n \in [10^5], m \in [100], y_1, y_2 \in \overline{0, 10^9}$.

Sample.

Problem 193 (CSES Problem Set/line segments trace II). There are $n \in \mathbb{N}^*$ line segments whose endpoints have integer coordinates. Each x -coordinate is between 0 & m . The slope of each segment is an integer. For each x -coordinate $0, 1, \dots, m$, find the maximum point in any line segment. If there is no segment at some point, the maximum is -1 .

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of line segments & the maximum x -coordinate. The next n lines describe the line segments. Each line has 4 integers x_1, y_1, x_2, y_2 : there is a line segment between points $(x_1, y_1), (x_2, y_2)$.

Output. Print $m + 1$ integers: the maximum points for $x = 0, 1, \dots, m$.

Constraints. $m, n \in [10^5], 0 \leq x_1 < x_2 \leq m, y_1, y_2 \in \overline{0, 10^9}$.

Problem 194 (CSES Problem Set/lines & queries I). Efficiently process the following types of queries:

1. Add a line $ax + b$.
2. Find the maximum point in any line at position x .

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of queries. The following n lines describe the queries. The format of each line is either 1 a b or 2 x. You may assume that the 1st query is of type 1.

Output. Print the answer for each query of type 2.

Constraints. $n \in [2 \cdot 10^5]$, $a, b \in \overline{-10^9, 10^9}$, $x \in \overline{0, 10^5}$.

Problem 195 (CSES Problem Set/lines & queries II). Efficiently process the following types of queries:

1. Add a line $ax + b$ that is active in range $[l, r]$.
2. Find the maximum point in any active line at position x .

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of queries. The following n lines describe the queries. The format of each line is either 1 a b l r or 2 x.

Output. Print the answer for each query of type 2. If no line is active, print NO.

Constraints. $n \in [2 \cdot 10^5]$, $a, b \in \overline{-10^9, 10^9}$, $x, l, r \in \overline{0, 10^5}$.

Problem 197 (CSES Problem Set/robot path). You are given a description of a robot's path. The robot begins at point $(0, 0)$ & performs $n \in \mathbb{N}^*$ commands. Each command moves the robot some distance up, down, left, or right. The robot will stop when it has performed all commands, or immediately when it returns to a point that it has already visited. Calculate the total distance the robot moves.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of commands. After that, there are n lines describing the commands. each line has a character d & an integer $x \in \mathbb{N}^*$: the robot moves the distance x to the direction d . Each direction is U, D, L, R (up, down, left, right).

Output. Print the total distance the robot moves.

Constraints. $n \in [10^5], x \in [10^6]$.

16.1 Divisor – Ước Số

Problem 199 (IMO2007P5). Let $a, b \in \mathbb{N}^*$. Show that if $4ab - 1 \mid (4a^2 - 1)^2$, then $a = b$.

Bài toán 42 (CP version of IMO2007P5). Cho $m, n \in \mathbb{N}^*$. Đếm số phần tử của tập hợp

$$S = \{(a, b) \in [m] \times [n]; 4ab - 1 \mid (4a^2 - 1)^2\} = \{(a, b) \in [m] \times [n]; (4a^2 - 1)^2 : 4ab - 1\}.$$

Input. Chỉ 1 dòng chứa $m, n \in \mathbb{N}^*$.

Output. $|S|$.

Sample.

IMO2007_P5.inp	IMO2007_P5.out
5 3	3
10 15	10

Solution. Theo lời giải bài toán IMO2007P5 trước đó, đáp số bài toán này đơn giản chỉ là $\min\{m, n\}$. Nhưng đó là về mặt chứng minh toán học, sau đây ta sẽ dùng vòng lặp để kiểm tra.

C++:

1. DPAK's C++: IMO2007P5:

```
1  #include <iostream>
2  using namespace std;
3  int m, n;
4  const double oo = 1e9 + 7;
5
6  int main() {
7      cin >> m >> n;
8      int cnt = 0;
9      for (int a = 1; a <= m; ++a) {
10         int num = 4 * a * a - 1;
11         num = num * num;
12         for (int b = 1; b <= n; ++b) {
13             int divisor = 4 * a * b - 1;
14             if (num % divisor == 0) ++cnt;
15         }
16     }
```

```

16     }
17     cout << cnt;
18 }

```

2. TQS's & DNDK's C++: IMO2007P5:

```

1  #include <iostream>
2  using namespace std;
3
4  int main() {
5      int m, n, count = 0;
6      cin >> m >> n;
7      for (int i = 1; i <= m; ++i)
8          for (int j = 1; j <= n; ++j)
9              if (((4 * i * i - 1) * (4 * i * i - 1)) % (4 * i * j - 1) == 0) ++count;
10     cout << count;
11 }

```

Remark 7. Dù code này không cần dùng tới 2 biến phụ num, divisor như code của DPAK, nhưng sẽ tính nhiều lần hơn do đoạn code $(4 * i * i - 1) * (4 * i * i - 1)$ lặp lại phép tính $(4 * i * i - 1)$ 2 lần (unnecessary duplication).

□

Problem 200 (IMO2008P3). *Prove that there exists infinitely many positive integers n s.t. $n^2 + 1$ has a prime divisor which is $> 2n + \sqrt{2n}$.*

Bài toán 43 ([VL24], p. 12, IMO2008P3). *Chứng minh tồn tại vô hạn $n \in \mathbb{N}^*$ sao cho $n^2 + 1$ có ước nguyên tố lớn hơn $2n + \sqrt{2n}$.*

Bài toán 44 (CP version of IMO2008P3). *Đếm số số $n \in \mathbb{N}^*$ sao cho $n^2 + 1$ có ước nguyên tố lớn hơn $2n + \sqrt{2n}$ trong phạm vi $n \in [a, b]$ với $a, b \in \mathbb{N}^*$ cho trước.*

Input. 2 số $a, b \in \mathbb{N}^*$.

Output. Số số $n \in [a, b]$ thỏa mãn.

Solution. C++:

1. DPAK's C++: IMO2008P3:

```

1  #include <iostream>
2  #include <cmath>
3  using namespace std;
4  long long a, b;
5  const double oo = 1e9 + 7;
6
7  int main() {
8      long long cnt = 0;
9      cin >> a >> b;
10     for (long long i = a; i <= b; ++i) {
11         long long new_num = i * i + 1;
12         double limit = 2.0 * i + sqrt(2 * i);
13         long long temp = new_num;
14         bool ok = false;
15         for (long long j = 2; j * j <= new_num; ++j)
16             if (temp % j == 0) {
17                 while (temp % j == 0) temp /= j;
18                 if (j > limit) {
19                     ok = true;
20                     break;
21                 }
22             }
23         if (!ok && temp > 1 && temp > limit) ok = true;
24         if (ok) ++cnt;
25     }

```

```

26     cout << cnt;
27 }

```

2. DNDK's C++: IMO2008P3:

```

1  #include <iostream>
2  #include <cmath>
3  using namespace std;
4
5  bool check(long long n) {
6      long long x = n * n + 1, X = x;
7      long long y = 2 * n + sqrtl(2 * n);
8      for (long long i = 2; i * i <= X; ++i)
9          if (x % i == 0) {
10             while (x % i == 0) x /= i;
11             if (i > y) return true;
12         }
13     if (x > 1 and x > y) return true;
14     return false;
15 }
16
17 int main() {
18     long long a, b;
19     cin >> a >> b;
20     long long count = 0;
21     for (long long i = a; i <= b; ++i)
22         if (check(i)) ++count;
23     cout << count;
24 }

```

□

Problem 201 (IMO2011P1). Given any set $A = \{a_1, a_2, a_3, a_4\}$ of 4 distinct positive integers, we denote $s_A := a_1 + a_2 + a_3 + a_4$. Let n_A denote the number of pairs (i, j) with $1 \leq i < j \leq 4$ for which $a_i + a_j \mid s_A$. Find all sets A of 4 distinct positive integers which achieve the largest possible value of n_A .

Bài toán 45 ([VL24], 1., p. 17, IMO2011P1). Cho tập hợp $A = \{a_1, a_2, a_3, a_4\}$ gồm 4 số nguyên phân biệt, ta ký hiệu tổng $a_1 + a_2 + a_3 + a_4$ bởi s_A . Giả sử n_A là số các cặp (i, j) với $1 \leq i < j \leq 4$ sao cho $a_i + a_j \mid s_A$. Tìm tất cả các tập hợp A gồm 4 số nguyên dương phân biệt mà với chúng n_A đạt được GTLN có thể.

Bài toán 46. Viết thuật toán & chương trình C/C++, Pascal, Python để minh họa IMO2011P1.

16.2 Primorial

In mathematics, & more particular in number theory, *primorial*, denoted by $p_n\# : \mathbb{N} \rightarrow \mathbb{N}$ similar to the **factorial** function, but rather than successively multiplying positive integers, the function only multiplies prime numbers. The name “primorial”, coined by **HARVEY DUBNER**, draws an analogy to *primes* similar to the way the name “factorial” relates to *factors*.

– Trong toán học, & cụ thể hơn trong lý thuyết số, *primorial*, được ký hiệu là $p_n\# : \mathbb{N} \rightarrow \mathbb{N}$ tương tự như hàm giai thừa, nhưng thay vì nhân liên tiếp các số nguyên dương, hàm này chỉ nhân các số nguyên tố. Tên “primorial”, do HARVEY DUBNER đặt ra, có sự tương tự với *primes* tương tự như cách tên “factorial” liên quan đến các thừa số.

Definition 5 (Primorial for prime numbers). For the n th prime number p_n , the primorial $p_n\#$ is defined as the product of the 1st n primes: $p_n\# = \prod_{i=1}^n p_i$, where p_i is the i th prime number.

The 1st few primorials $p_n\#$ are 1, 2, 6, 30, 210, 2310, 30030, 510510, 9699690, ... (sequence A002110 in the OEIS). Asymptotically, primorials $p_n\#$ grow according to $p_n\# = e^{(1+o(1))n \log n}$.

Definition 6. The primorial $n\#$ for $n \in \mathbb{N}^*$ is the product of the primes that are not greater than n , i.e.,

$$n\# = \prod_{p \leq n, p \text{ prime}} p = \prod_{i=1}^{\pi(n)} p_i = p_{\pi(n)}\#,$$

where $\pi(n)$ is the **prime-counting function** (sequence A000720 in the OEIS), which gives the number of primes $\leq n$. This is equivalent to:

$$n\# = \begin{cases} 1 & \text{if } n = 0, 1, \\ (n-1)\# \times n & \text{if } n \text{ is prime,} \\ (n-1)\# & \text{if } n \text{ is composite.} \end{cases}$$

Example 3. $12\# = 2 \cdot 3 \cdot 5 \cdot 7 \cdot 11 = 2310$. Since $\pi(12) = 5$, this can be calculated as $12\# = p_{\pi(12)}\# = p_5\# = 2310$.

Consider the 1st 12 values of $n\#$: 1, 2, 6, 6, 30, 30, 210, 210, 210, 210, 2310, 2310. We see that for composite n every term $n\#$ simply duplicates the preceding term $(n-1)\#$, as given in the definition. Since 12 is a composite number, $12\# = p_5\# = 11\#$.

Primorials are related to the 1st **Chebyshev function**, written $\vartheta(n)$ or $\theta(n)$ according to $\ln(n\#) = \vartheta(n)$. Since $\vartheta(n)$ asymptotically approaches n for large values of n , primorials therefore grow according to $n\# = e^{(1+o(1))n}$. The idea of multiplying all known primes occur in some proofs of the **infinitude of the prime numbers**, where it is used to derive the existence of another prime.

Theorem 3 (Characteristics of primorials). (a) Let p, q be 2 adjacent prime numbers. Given any $n \in \mathbb{N}$, where $p \leq n < q$, $n\# = p\#$.

(b) The fact that the binomial coefficient $\binom{2n}{n}$ is divisible by every prime between $n+1$ & $2n$, together with the inequality $\binom{2n}{n} \leq 2^n$, allows to derive the upper bound $n\# \leq 4^n$.

16.3 Divisor function – Hàm ước số

Resources – Tài nguyên.

1. [Wikipedia/divisor function](#).

In mathematics, & specifically in **number theory**, a *divisor function* is an **arithmetic function** related to the **divisors** of an integer. When referred to as the divisor function, it counts the *number of divisors of an integer* (including 1 & the number itself). It appears in a number of remarkable identities, including relationships on the **Riemann zeta function** & the **Eisenstein series of modular forms**. Divisor functions were studied by **RAMANUJAN**, who gave a number of important **congruences & identities**; these are treated separately in [Wikipedia/Ramanujan's sum](#).

Definition 7. The sum of positive divisors function $\sigma_z(n)$, for a real or complex number z , is defined as the sum of the z th powers of the positive divisors of n . It can be expressed in **sigma notation** as

$$\sigma_z(n) = \sum_{d|n} d^z, \quad \forall n \in \mathbb{N}^*.$$

The notation $d(n), \nu(n), \tau(n)$ (for the German *Teiler* = divisors) are also used to denote $\sigma_0(n)$, or the *number-of-divisors function* (OEIS: [A000005](#)). When $z = 1$, the function is called the *sigma function* or *sum-of-divisors function*, & the subscript is often omitted, so $\sigma(n)$ is the same as $\sigma_1(n)$ (OEIS: [A000203](#)).

The **aliquot sum** $s(n)$ of n is the sum of the **proper divisors** (i.e., the divisors excluding n itself, OEIS: [A001065](#)), & equals $\sigma_1(n) - n$; the **aliquot sequence** of n is formed by repeatedly applying the aliquot sum function.

Example 4. The number of divisors of 12 is $\sigma_0(12) = 6$, the sum of all the divisors of 12 is $\sigma_1(12) = 1 + 2 + 3 + 4 + 6 + 12 = 28$, & the aliquot sum $s(12) = 1 + 2 + 3 + 4 + 6 = 16$. $\sigma_{-1}(n)$ is sometimes called the **abundancy index** of n , & we have $\sigma_{-1}(12) = 1^{-1} + 2^{-1} + 3^{-1} + 4^{-1} + 6^{-1} + 12^{-1} = \frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{6} + \frac{1}{12} = \frac{12+6+4+3+2+1}{12} = \frac{28}{12} = \frac{7}{3} = \frac{\sigma_1(12)}{12}$.

Theorem 4. For any prime number p : (a) $\sigma_0(p) = 2, \sigma_1(p) = p + 1$. (b) $\sigma_0(p^n) = n + 1, \sigma_1(p^n) = \sum_{i=0}^n p^i = \frac{p^{n+1} - 1}{p - 1}, \forall n \in \mathbb{N}$. (c) $\sigma_0(p_n\#) = 2^n$ where $p_n\#$ denotes the **primorial**

Advanced Techniques – Các Kỹ Thuật Nâng Cao

Problem 202 (CSES Problem Set/meet in the middle). You are given an array of $n \in \mathbb{N}^*$ numbers. In how many ways can you choose a subset of the numbers with sum $x \in \mathbb{N}^*$?

Input. The 1st input line has 2 integers $n, x \in \mathbb{N}^*$: the array size & the required sum. The 2nd line has n integers t_1, \dots, t_n : the numbers in the array.

Output. Print the number of ways you can create the sum x .

Constraints. $n \in [40], x \in [10^9], t_i \in [10^9], \forall i \in [n]$.

Sample.

meet_middle.inp	meet_middle.out
4 5 1 2 3 2	3

Problem 203 (CSES Problem Set/Hamming distance). The Hamming distance between 2 strings a, b of equal length is the number of positions where the strings differ. You are given $n \in \mathbb{N}^*$ bit strings, each of length $k \in \mathbb{N}^*$ & your task is to calculate the minimum Hamming distance between 2 strings.

Input. The 1st input line has 2 integer $n \in \mathbb{N}^*$: the number of bit strings & their length. Then there are n lines each consisting of 1 bit string of length k .

Output. Print the minimum Hamming distance between 2 strings.

Constraints. $2 \leq n \leq 2 \cdot 10^4, k \in [30]$.

Sample.

Hamming_distance.inp	Hamming_distance.out

C++:

1. NHT's C++: Hamming distance.

```
1  #include <bits/stdc++.h>
2  using namespace std;
3
4  const int maxN = 2e4;
5  int N, ans, b[maxN];
6
7  int scanBinary() {
8      char c;
9      int res = 0;
10     while ((c = getchar()) != '\n') {
11         res <<= 1;
12         res += (c - '0') & 1;
13     }
```

```

14     return res;
15 }
16
17 int main() {
18     scanf("%d %d ", &N, &ans);
19     for (int i = 0; i < N; i++)
20         b[i] = scanBinary();
21
22     for (int i = 0; i < N; i++)
23         for (int j = i + 1; j < N; j++)
24             ans = min(ans, __builtin_popcount(b[i] ^ b[j]));
25
26     printf("%d\n", ans);
27 }

```

Problem 204 (CSES Problem Set/corner subgrid check). You are given a grid of letters. Find subgrids whose height & width is at least 2 & all the corners have the same letter. For each letter, check if there is a valid subgrid whose corners have that letter.

Input. The 1st input line has 2 integers $n, k \in \mathbb{N}^*$: the size of the grid & the number of letters. The letters are the 1st k uppercase letters. After this, there are n lines that describe the grid. Each line has n letters.

Output. Print k lines: for each letter, YES if there is a valid subgrid & NO otherwise.

Constraints. $n \in [3000], k \in [26]$.

Sample.

corner_subgrid_check.inp	corner_subgrid_check.out

AAAA	NO

Problem 205 (CSES Problem Set/corner subgrid count). You are given an $n \times n$ grid whose each square is either black or white. A subgrid is called beautiful if its height & width is at least 2 & all of its corners are black. How many beautiful subgrids are there within the given grid?

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the size of the grid. Then there are n lines describing the grid: 1 means that a square is black & 0 means it is white.

Output. Print the number of beautiful subgrids.

Constraints. $n \in [3000]$.

Sample.

Problem 206 (CSES Problem Set/reachable nodes). A directed acyclic graph consists of $n \in \mathbb{N}^*$ nodes & $m \in \mathbb{N}^*$ edges. The nodes are numbered $1, 2, \dots, n$. Calculate for each node the number of nodes you can reach from that node (including the node itself).

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of nodes & edges. Then there are m lines describing the edges. Each line has 2 distinct integers $a, b \in \mathbb{N}^*$: there is an edge from node a to node b .

Output. Print n integers: for each node the number of reachable nodes.

Constraints. $n \in [5 \cdot 10^4], m \in [10^5]$.

Sample.

Problem 207 (CSES Problem Set/reachability queries). A directed graph consists of $n \in \mathbb{N}^*$ nodes & $m \in \mathbb{N}^*$ edges. The edges are numbered $1, 2, \dots, n$. Answer q queries of the form “can you reach node b from node a ?”

Input. The 1st input line has 3 integers $n, m, q \in \mathbb{N}^*$: the number of nodes, edges, & queries. Then there are m lines describing the edges. Each line has 2 distinct integers a, b : there is an edge from node a to node b . Finally there are q lines describing the queries. Each line consists of 2 integers a, b : “can you reach node b from node a ?”

Output. Print the answer for each query: either YES or NO.

Constraints. $n \in [5 \cdot 10^4], m \in [100], q \in [10^5]$.

Problem 208 (CSES Problem Set/cut & paste). Given a string, process operations where you cut a substring & paste it to the end of the string. What is the final string after all the operations?

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the length of the string & the number of operations. The characters of the string are numbered $1, 2, \dots, n$. The next line has a string of length n that consists of characters A-Z. Finally, there are m lines that describe the operations. Each line has 2 integers $a, b \in \mathbb{N}^*$: you cut a substring from position a to position b .

Output. Print the final string after all the operations.

Constraints. $m, n \in [2 \cdot 10^5], 1 \leq a \leq b \leq n$.

Problem 210 (CSES Problem Set/reversals & sums). Given an array of $n \in \mathbb{N}^*$ integers, you have to process following operations:

1. Reverse a subarray
2. Calculate the sum of values in a subarray.

Input. The 1st input line has 2 integer $n, m \in \mathbb{N}^*$: the size of the array & the number of operations. The array elements are numbered $1, 2, \dots, n$. The next line has n integers x_1, x_2, \dots, x_n : the contents of the array. Finally, there are m lines that describe the operations. Each line has 3 integers t, a, b . If $t = 1$, you should reverse a subarray from a to b . If $t = 2$, you should calculate the sum of values from a to b .

Output. Print the answer to each operation where $t = 2$.

Constraints. $n \in [2 \cdot 10^5], m \in [10^5], x_i \in [0, 10^9], 1 \leq a \leq b \leq n$.

Problem 211 (CSES Problem Set/necessary roads). There are $n \in \mathbb{N}^*$ cities & $m \in \mathbb{N}^*$ roads between them. There is a route between any 2 cities. A road is called necessary if there is no route between some 2 cities after removing that road. Find all necessary roads.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of cities & roads. The cities are numbered $1, 2, \dots, n$. After this, there are m lines that describe the roads. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is a road between cities a & b . There is at most 1 road between 2 cities, & every road connects 2 distinct cities.

Output. 1st print an integer: the number of necessary roads. After that, print k lines that describe the roads. You may print the roads in any order.

Constraints. $n \in [2, 10^5], m \in [2 \cdot 10^5], a, b \in [n]$.

Problem 213 (CSES Problem Set/Eulerian subgraphs). You are given an undirected graph that has $n \in \mathbb{N}^*$ nodes & $m \in \mathbb{N}^*$ edges. We consider subgraphs that have all nodes of the original graph & some of its edges. A subgraph is called Eulerian if each node has even degree. Count the number of Eulerian subgraphs modulo $10^9 + 7$.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of nodes & edges. The nodes are numbered $1, 2, \dots, n$. After this, there are m lines that describe the edges. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is an edge between nodes a & b . There is at most 1 edge between 2 nodes, & each edge connects 2 distinct nodes.

Output. Print the number of Eulerian subgraphs modulo $10^9 + 7$.

Constraints. $n \in [10^5], m \in [100], x_i \in \{0, 1, \dots, m\}$.

Sample.

Eulerian_subgraph.inp	Eulerian_subgraph.out
4 3	2
1 2	
1 3	
2 3	

Explanation. You can either keep or remove all edges, so there are 2 possible Eulerian subgraphs.

Problem 214 (CSES Problem Set/monster game I). You are playing a game that consists of $n \in \mathbb{N}^*$ levels. Each level has a monster. On levels $1, 2, \dots, n-1$, you can either kill or escape the monster. However, on level n you must kill the final monster to win the game. Killing a monster takes sf time where s is the monster's strength & f is your skill factor (lower skill factor is better). After killing a monster, you get a new skill factor. What is the minimum total time in which you can win the game?

Input. The 1st input line has 2 integers $n, x \in \mathbb{N}^*$: the number of levels & your initial skill factor. The 2nd line has n integers $s_1, s_2, \dots, s_n \in \mathbb{N}^*$: each monster's strength. The 3rd line has n integers $f_1, f_2, \dots, f_n \in \mathbb{N}^*$: your new skill factor after killing a monster.

Output. Print 1 integer: the minimum total time to win the game.

Constraints. $n \in [2 \cdot 10^5], x \in [10^6], 1 \leq s_1 \leq s_2 \leq \dots \leq s_n \leq 10^6, x \geq f_1 \geq f_2 \geq \dots \geq f_n \geq 1$.

Explanation. The best way to play is to kill the 3rd & 5th monsters.

Problem 215 (CSES Problem Set/monster game II). You are playing a game that consists of $n \in \mathbb{N}^*$ levels. Each level has a monster. On levels $1, 2, \dots, n-1$, you can either kill or escape the monster. However, on level n you must kill the final monster to win the game. Killing a monster takes sf time where s is the monster's strength & f is your skill factor. After killing a monster, you get a new skill factor (lower skill factor is better). What is the minimum total time in which you can win the game?

Input. The 1st input line has 2 integers $n, x \in \mathbb{N}^*$: the number of levels & your initial skill factor. The 2nd line has n integers $s_1, s_2, \dots, s_n \in \mathbb{N}^*$: each monster's strength. The 3rd line has n integers $f_1, f_2, \dots, f_n \in \mathbb{N}^*$: your new skill factor after killing a monster.

Output. Print 1 integer: the minimum total time to win the game.

Constraints. $n \in [2 \cdot 10^5], x \in [10^6], x \in [10^6], s_i, f_i \in [10^6]$.

Sample.

monster_game_II.inp	monster_game_II.out
5 100	2600
50 20 30 90 30	
60 20 20 10 90	

Explanation. The best way to play is to kill the 2nd & 5th monsters.

Problem 216 (CSES Problem Set/subarray squares). Given an array of $n \in \mathbb{N}^*$ elements, divide into $k \in \mathbb{N}^*$ subarrays. The cost of each subarray is the square of the sum of the values in the subarray. What is the minimum total cost if you act optimally?

Input. The 1st input line has 2 integers $n, k \in \mathbb{N}^*$: the array elements & the number of subarrays. The array elements are numbered $1, 2, \dots, n$. The 2nd line has n integers x_1, x_2, \dots, x_n : the contents of the array.

Output. Print 1 integer: the minimum total cost.

Constraints. $1 \leq k \leq n \leq 3000, x_i \in [10^5], \forall i \in [n]$.

Sample.

subarray_square.inp	subarray_square.out
8 3	110
2 3 1 2 2 3 4 1	

Explanation. An optimal solution is $[2, 3, 1], [2, 2, 3], [4, 1]$, whose cost is $(2 + 3 + 1)^2 + (2 + 2 + 3)^2 + (4 + 1)^2 = 110$.

Problem 217 (CSES Problem Set/houses & schools). There are $n \in \mathbb{N}^*$ houses on a street, numbered $1, 2, \dots, n$. The distance of houses a, b is $|a - b|$. You know the number of children in each house. Establish k schools in such a way that each school is in some house. Then, each child goes to the nearest school. What is the minimum total walking distance of the children if you act optimally?

Input. The 1st input line has 2 integers $n, k \in \mathbb{N}^*$: the number of houses & the number of schools. The houses are numbered $1, 2, \dots, n$. After this, there are n integers c_1, c_2, \dots, c_n : the number of children in each house.

Output. Print the minimum total distance.

Constraints. $1 \leq k \leq n \leq 3000, c_i \in [10^9], \forall i \in [n]$.

Sample.

house_school.inp	house_school.out
6 2	11
2 7 1 4 6 4	

Explanation. Houses 2, 5 will have schools.

Problem 218 (CSES Problem Set/Knuth division). Given an array of n numbers, divide it into n subarrays, each of which has a single element. On each move, you may choose any subarray & split it into 2 subarrays. The cost of such a move is the sum of values in the chosen subarray. What is the minimum total cost if you act optimally?

Input. The 1st input line has an integers $n \in \mathbb{N}^*$: the array size. The array elements are numbered $1, 2, \dots, n$. The 2nd line has n integers x_1, x_2, \dots, x_n : the contents of the array.

Output. Print 1 integer: the minimum total cost.

Constraints. $n \in [5000], x_i \in [10^9]$.

Sample.

Knuth_division.inp	Knuth_division.out
5	43
2 7 3 2 5	

Problem 219 (CSES Problem Set/apples & bananas). There are $n \in \mathbb{N}^*$ apples & $m \in \mathbb{N}^*$ bananas, & each of them has an integer weight between $1, \dots, k$. Calculate, for each weight w between $2, \dots, 2k$, the number of ways we can choose an apple & a banana whose combined weight is w .

Input. The 1st input line contains 3 integers $k, n, m \in \mathbb{N}^*$: the number K , the number of apples & the number of bananas. The next line contains n integers a_1, a_2, \dots, a_n : weight of each apple. The last line contains m integers b_1, b_2, \dots, b_m : weight of each banana.

Output. For each integer w between $2, \dots, 2k$, print the number of ways to choose an apple & a banana whose combined weight is w .

Constraints. $m, n, k \in [2 \cdot 10^5], a_i, b_j \in [k], \forall i \in [n], \forall j \in [m]$.

Sample.

apple_banana.inp	apple_banana.out
5 3 4	0 0 1 2 1 2 4 2 0
5 2 5	
4 3 2 3	

Explanation. E.g., for $w = 8$ there are 4 different ways: we can pick an apple of weight 5 into 2 different ways & a banana of weight 3 in 2 different ways.

Problem 220 (CSES Problem Set/1 bit positions). You are given a binary string of length n . Calculate, for every k between $1, \dots, n-1$, the number of ways we can choose 2 positions i, j s.t. $i - j = k$ & there is a 1-bit at both positions.

Input. The only input line has a string that consists only of characters 0, 1.

Output. For every distance k between $1, \dots, n-1$ print the number of ways we can choose 2 such positions.

Constraints. $n \in [2, 2 \cdot 10^5]$.

Sample.

one_bit_position.inp	one_bit_position.out
1001011010	1 2 3 0 2 1 0 1 0

Problem 221 (CSES Problem Set/signal processing). You are given 2 integer sequences: a signal & a mask. Process the signal by moving the mask through the signal from left to right. At each mask position calculate the sum of products of aligned signal & mask values in the part where the signal & the mask overlap.

Input. The 1st input line consists of 2 integers $n, m \in \mathbb{N}^*$: the length of the signal & the length of the mask. The next line consists of n integers a_1, a_2, \dots, a_n defining the signal. The last line consists of m integers b_1, b_2, \dots, b_m defining the mask.

Output. Print $n + m - 1$ integer: the sum of products of aligned values at each mask position from left to right.

Constraints. $m, n \in [2 \cdot 10^5], a_i, b_i \in [100]$.

Sample.

signal_processing.inp	signal_processing.out
5 3	3 11 13 10 16 9 4
1 3 2 1 4	
1 2 3	

Explanation. E.g., at the 2nd mask position the sum of aligned products is $2 \cdot 1 + 3 \cdot 3 = 11$.

Problem 222 (CSES Problem Set/new roads queries). There are $n \in \mathbb{N}^*$ cities in Byteland but no roads between them. However, each day, a new road will be built. There will be a total of $m \in \mathbb{N}^*$ roads. Process $q \in \mathbb{N}^*$ queries of the form: “after how many days can we travel from city a to city b for the 1st time?”

Input. The 1st input line has 3 integers $n, m, q \in \mathbb{N}^*$: the number of cities, roads, & queries. The cities are numbered $1, 2, \dots, n$. After this, there are m lines that describe the roads in the order they are built. Each line has 2 integers a, b : there will be a road between cities a & b . Finally, there are q lines that describe the queries. Each line has 2 integers a, b : we want to travel from city a to city b .

Output. For each query, print the number of days, or -1 if it is never possible.

Constraints. $m, n, q \in [2 \cdot 10^5], a, b \in [n]$.

Sample.

new_roads_query.inp	new_roads_query.out
5 4 3	2
1 2	-1
2 3	4
1 3	
2 5	
1 3	
3 4	
3 5	

Problem 223 (CSES Problem Set/dynamic connectivity). Consider an undirected graph that consists of $n \in \mathbb{N}^*$ nodes & $m \in \mathbb{N}^*$ edges. There are 2 types of events that can happen:

1. A new edge is created between nodes a, b .
2. An existing edge between nodes a, b is removed.

Report the number of components after every event.

Input. The 1st input line has 3 integers $n, m, k \in \mathbb{N}^*$: the number of nodes, edges, & events. After this there are m lines describing the edges. Each line has 2 integers a, b : there is an edge between nodes a, b . There is at most 1 edge between any pair of nodes. Then there are k lines describing the events. Each line has the form $t \ a \ b$ where $t = 1$ (create a new edge) or $t = 2$ (remove an edge). A new edge is always created between 2 nodes that do not already have an edge between them, & only existing edges can get removed.

Output. Print $k + 1$ integers: 1st the number of components before the 1st event, & after this the new number of components after each event.

Constraints. $n \in \overline{2, 10^5}$, $m, k \in [10^5]$, $a, b \in [n]$.

Sample.

dynamic_connectivity.inp	dynamic_connectivity.out
5 3 3	2 2 2 1

1 2 5	
2 3 5	
1 1 2	

Problem 224 (CSES Problem Set/parcel delivery). There are $n \in \mathbb{N}^*$ cities & $m \in \mathbb{N}^*$ routes through which parcels can be carried from 1 city to another city. For each route, you know the maximum number of parcels & the cost of a single parcel. You want to send k parcels from Syrjäla to Lehmälä. What is the cheapest way to do that?

Input. The 1st input line has 3 integers $n, m, k \in \mathbb{N}^*$: the number of cities, routes, & parcels. The cities are numbered $1, 2, \dots, n$. City 1 is Syrjäla & city n is Lehmälä. After this, there are m lines that describe the routes. Each line has 4 integers a, b, r, c : there is a route from city a to city b , at most r parcels can be carried through the route, & the cost of each parcel is c .

Output. Print 1 integer: the minimum total cost or -1 if there are no solutions.

Constraints. $2 \leq n \leq 500$, $m \in [1000]$, $k \in [100]$, $a, b \in [n]$, $r, c \in [1000]$.

Sample.

parcel_delivery.inp	parcel_delivery.out
4 5 3	750
1 2 5 100	
1 3 10 50	
1 4 7 500	
2 4 8 350	
3 4 2 100	

Explanation. 1 parcel is delivered through route $1 \rightarrow 2 \rightarrow 4$ (cost $1 \cdot 450 = 450$) & 2 parcels are delivered through route $1 \rightarrow 3 \rightarrow 4$ (cost $2 \cdot 150 = 300$).

Problem 225 (CSES Problem Set/task assignment). A company has $n \in \mathbb{N}^*$ employees & there are n tasks that need to be done. We know for each employee the cost of carrying out each task. Every employee should be assigned to exactly 1 task. What is the minimum total cost if we assign the task's optimally & how could they be assigned?

Input. The 1st input line has 1 integer $n \in \mathbb{N}^*$: the number of employees & the number of tasks that need to be done. After this, there are n lines each consisting of n integers. The i th line consists of integers $c_{i1}, c_{i2}, \dots, c_{in}$: the cost of each task when it is assigned to the i th employee.

Output. 1st print the minimum total cost. Then print n lines each consisting of 2 integers a, b : you assign the b th task to the a th employee. If there are multiple solutions you can print any of them.

Constraints. $n \in [200], c_{ij} \in [1000]$.

Sample.

task_assignment.inp	task_assignment.out
4	33

7 15 12 19	2 1
6 9 10 11	3 3
14 7 13 10	4 2

Explanation. The minimum total cost is 33. We can reach this by assigning employee 1 task 4, employee 2 task 1, employee 3 task 3, & employee 4 task 2. This will cost $9 + 7 + 10 + 7 = 33$.

Problem 226 (CSES Problem Set/distinct routes II). A game consists of $n \in \mathbb{N}^*$ rooms & $m \in \mathbb{N}^*$ teleporters. At the beginning of each day, you start in room 1 & you have to reach room n . You can use each teleporter at most once during the game. You want to play the game for exactly k days. Every time you use any teleporter you have to pay 1 coin. What is the minimum number of coins you have to pay during k days if you play optimally?

Input. The 1st input line has 3 integers $n, m, k \in \mathbb{N}^*$: the number of rooms, the number of teleporters & the number of days you play the game. The rooms are numbered $1, 2, \dots, n$. After this, there are m lines describing the teleporters. Each line has 2 integers a, b : there is a teleporter from room a to room b . There are no 2 teleporters whose starting & ending room are the same.

Output. 1st print 1 integer: the minimum number of coins you have to pay if you pay optimally. Then, print k route descriptions according to the example. You can print any valid solution. If it is not possible to play the game for k days, print only -1 .

Constraints. $2 \leq n \leq 500, m \in [1000], 1 \leq k \leq n - 1, 1 \leq a, b \leq n$.

Problem 230 (CSES Problem Set/number of subset xors). Given an array of $n \in \mathbb{N}^*$ integers, find the number of different subset xors.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the size of the array. The next line has n integers x_1, x_2, \dots, x_n : the contents of the array.

Output. *Print 1 integer: the number of different subset xors.*

Constraints. $n \in [2 \cdot 10^5], x_i \in [0, 10^9], \forall i \in [n]$.

Sample.

number_subset_xor.inp	number_subset_xor.out
3	4
3 6 5	

Explanation. *The following values can be the xor of a subset: $0 = \text{xor of the empty set}$, $3 = 3$, $5 = 3 \oplus 6$, $6 = 3 \oplus 5$. In this case, no other values can be the xor of a subset.*

Problem 231 (CSES Problem Set/k subset xors). *Given an array of $n \in \mathbb{N}^*$ integers. Consider the xors of all 2^n subsets of the array (including the empty subset with xor equal to zero). Find the k smallest subset xors.*

Input. *The 1st input line has 2 integers $n, k \in \mathbb{N}^*$: the size of the array & the number of subset xors k . The next line has n integers x_1, x_2, \dots, x_n : the contents of the array.*

Output. *Print k integers: the k smallest subset xors in increasing order.*

Constraints. $n \in [2 \cdot 10^5], k \in [\min\{2^n, 2 \cdot 10^5\}], x_i \in \{0, 1, \dots, m\}$.

Sample.

Problem 236 (CSES Problem Set/SOS bit problem). Given a list of $n \in \mathbb{N}^*$, calculate for each element x :

1. the number of elements y s.t. $x|y = x$
2. the number of elements y s.t. $x \& y = x$
3. the number of elements y s.t. $x \& y \neq 0$.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the size of the list. The next line has n integers x_1, x_2, \dots, x_n : the elements of the list.

Output. Print n integers: for each element the required values.

Constraints. $n \in [2 \cdot 10^5], x_i \in [10^6], \forall i \in [n]$.

Sample.

Construction Problems – Các Bài Toán Xây Dựng

Problem 238 (CSES Problem Set/inverse inversions). Create a permutation of $[n]$ that has exactly k inversions. An inversion is a pair (a, b) where $a < b$ & $p_a > p_b$ where p_i denotes the number at position i in the permutation.

Input. The only input line has 2 integers $n, k \in \mathbb{N}^*$.

Output. Print a line that contains the permutation. You can print any valid solution.

Constraints. $n \in [10^6], k \in [0, \frac{n(n-1)}{2}]$.

Sample.

inverse_inversion.inp	inverse_inversion.out
5 4	1 5 2 4 3

Problem 239 (CSES Problem Set/monotone subsequences). Create a permutation of $[n]$ whose longest monotone subsequence has exactly $k \in \mathbb{N}^*$ elements. A monotone subsequence is either increasing or decreasing, e.g., some monotone subsequences in $[2, 1, 4, 5, 3]$ are $[2, 4, 5]$, $[4, 3]$.

Input. The 1st input line has an integer $t \in \mathbb{N}^*$: the number of tests. After this, there are t lines. Each line has 2 integers $n, k \in \mathbb{N}^*$.

Output. For each test, print a line that contains the permutation. You can print any valid solution. If there are no solutions, print IMPOSSIBLE.

Constraints. $t \in [10^3], 1 \leq k \leq n \leq 100$.

Sample.

monotone_subsequence.inp	monotone_subsequence.out

Problem 241 (CSES Problem Set/permutation prime sums). Given $n \in \mathbb{N}^*$, create 2 permutations a, b of size n s.t. $a_i + b_i$ is prime for $i \in [n]$.

Input. The only input line has an integer n .

Output. Print 2 permutations. You can print any valid solution. If there are no solutions, print IMPOSSIBLE.

Constraints. $n \in [10^5]$.

Sample.

permutation_prime_sum.inp	permutation_prime_sum.out
5	2 1 3 5 4 5 1 4 2 3

Explanation. The sums are $2 + 5 = 7, 1 + 1 = 2, 3 + 4 = 7, 5 + 2 = 7, 4 + 3 = 7$ which are all primes.

Problem 242 (CSES Problem Set/chess tournament). There will be a chess tournament of $n \in \mathbb{N}^*$ players. Each player has announced the number of games they want to play. Each pair of players can play at most one game. Your task is to determine which games will be played so that everybody will be happy.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of players. The players are numbered $1, 2, \dots, n$. The next line has n integers x_1, x_2, \dots, x_n : for each player, the number of games they want to play.

Output. 1st print an integer k : the number of games. Then, print k lines describing the games. You can print any valid solution. If there are no solutions, print IMPOSSIBLE.

Constraints. $n \in [10^5], \sum_{i=1}^n x_i \in [2 \cdot 10^5]$.

Sample.

chess_tournament.inp	chess_tournament.out

Problem 243 (CSES Problem Set/distinct sums grid). Create an $n \times n$ grid that fulfills the following requirements:

1. Each integer $1, \dots, n$ appears n times in the grid.
2. If we create a set that consists of all sums in rows & columns, there are $2n$ distinct values.

Input. The only input line has an integer $n \in \mathbb{N}^*$.

Output. Print a grid that fulfills the requirements. You can print any valid solution. If there are no solutions, print IMPOSSIBLE.

Constraints. $n \in [10^3]$.

Sample.

.inp	.out
5	2 3 1 1 1 21 5 5 3 3 22 3 5 2 4 25 4 5 4 1 22 3 4 4 2

Explanation. Each integer $1, 2, 3, 4, 5$ appears 5 times, & the sums in rows & columns are $\{8, 11, 12, 14, 15, 16, 17, 18, 19, 20\}$.

Problem 244 (CSES Problem Set/filling trominos). Fill an $n \times m$ grid using L -trominos (3 squares that have an L -shape).

Input. The 1st input line has an integer $t \in \mathbb{N}^*$: the number of tests. After that, there are t lines that describe the tests. Each line has 2 integers $n, m \in \mathbb{N}^*$.

Output. For each test, print YES if there is a solution, & NO otherwise. If there is a solution, also print n lines that each contain m letters between A–Z. Adjacent squares must have the same letter exactly when they belong to the same tromino. You can print any valid solution.

Constraints. $t, m, n \in [100]$.

Sample.

Problem 245 (CSES Problem Set/grid path construction). Given an $n \times m$ grid & 2 squares $a = (y_1, x_1), b = (y_2, x_2)$, create a path from a to b that visits each square exactly once.

Input. The 1st input line has an integer $t \in \mathbb{N}^*$: the number of tests. After this, there are t lines that describe the tests. Each line has 6 integers n, m, y_1, x_1, y_2, x_2 . In all tests $y_1, y_2 \in [n], x_1, x_2 \in [m]$. In addition, $y_1 \neq y_2$ or $x_1 \neq x_2$.

Output. Print YES, if it is possible to construct a path, & NO otherwise. If there is a path, also print its description which consists of characters U, D, L, R (up, down, left, right). If there are several paths, you can print any of them.

Constraints. $t \in [100], m, n \in [50]$.

Advanced Graph Problems – Các Bài Toán Đồ Thị Nâng Cao

Problem 246 (CSES Problem Set/nearest shops). There are $n \in \mathbb{N}^*$ cities & $m \in \mathbb{N}^*$ roads. Each road is bidirectional & connects 2 cities. It is also known that $k \in \mathbb{N}^*$ cities have an anime¹ shop. If you live in a city, you of course know the local anime shop well if there is one. You would like to find the nearest anime shop that is not in your city. For each city, determine the minimum distance to another city that has an anime shop.

Input. The 1st input line has 3 integers $n, m, k \in \mathbb{N}^*$: the number of cities, roads, & anime shops. The cities are numbered $1, 2, \dots, n$. The next line contains k integers: the cities that have an anime shop. Finally, there are m lines that describe the roads. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is a road between cities a & b .

Output. Print n integers: for each city, the minimum distance to another city with an anime shop. If there is no such city, print -1 instead.

Constraints. $1 \leq k \leq n \leq 10^5, m \in \overline{0, 2 \cdot 10^5}$.

Problem 247 (CSES Problem Set/Prüfer code). A Prüfer code of a tree of $n \in \mathbb{N}^*$ nodes is a sequence of $n - 2$ integers that uniquely specifies the structure of the tree. The code is constructed as follows: As long as there are at least 3 nodes left, find a leaf with the smallest label, add the label of its only neighbor to the code, & remove the leaf from the tree. Given a Prüfer code of a tree, your task is to construct the original tree.

Input. The 1st input line contains an integer $n \in \mathbb{N}^*$: the number of nodes. The nodes are numbered $1, 2, \dots, n$. The 2nd line contains $n - 2$ integers: the Prüfer code.

Output. Print $n - 1$ lines describing the edges of the tree. Each line has to contain 2 integers $a, b \in \mathbb{N}^*$: there is an edge between nodes a & b . You can print the edges in any order.

Constraints. $n \in \overline{3, 2 \cdot 10^5}, a, b \in [n]$.

¹NQBH: ordinary types, not hentai ones.

Problem 248 (CSES Problem Set/tree traversals). There are 3 common ways to traverse the nodes of a binary node:

1. Preorder: 1st process the root, then the left subtree, & finally the right subtree.
2. Inorder: 1st process the left subtree, then the root, & finally the right subtree.
3. Postorder: 1st process the left subtree, then the right subtree, & finally the root.

There is a binary tree of $n \in \mathbb{N}^*$ nodes with distinct labels. You are given the preorder & inorder traversals of the tree, determine its postorder traversal.

Input. The 1st input line has an integer $n \in \mathbb{N}^*$: the number of nodes. The nodes are numbered $1, 2, \dots, n$. After this, here are 2 lines describing the preorder & inorder traversals of the tree. Both lines consist of n integers. You can assume that the input corresponds to a binary tree.

Output. Print the postorder traversal of the tree.

Constraints. $n \in [10^5]$.

Problem 249 (CSES Problem Set/course schedule II). You want to complete $n \in \mathbb{N}^*$ courses that have requirements of the form “course a has to be completed before course b ”. You want to complete course 1 as soon as possible. If there are several ways to do this, you want then to complete course 2 as soon as possible, & so on. Determine the order in which you complete the courses.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of courses & requirements. The courses are numbered $1, 2, \dots, n$. Then, there are m lines describing the requirements. Each line has 2 integers $a, b \in \mathbb{N}^*$: course a has to be completed before course b . You can assume that there is at least 1 valid schedule.

Output. Print 1 line having n integers: the order in which you complete the courses.

Constraints. $n \in [10^5], m \in [2 \cdot 10^5], a, b \in [n]$.

Problem 251 (CSES Problem Set/strongly connected edges). Given an undirected graph, choose a direction for each edge so that the resulting directed graph is strongly connected.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of nodes & edges. The nodes are numbered $1, 2, \dots, n$. After this, there are m lines describing the edges. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is an edge between nodes a & b . You may assume that the graph is simple, i.e., there are at most 1 edge between 2 nodes & every edge connects 2 distinct nodes.

Output. Print m lines describing the directions of the edges. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is an edge from node a to node b . You can print any valid solution. If there are no solutions, only print IMPOSSIBLE.

Constraints. $n \in [10^5], m \in [2 \cdot 10^5], a, b \in [n]$.

Problem 254 (CSES Problem Set/fixed length walk queries). You are given an undirected graph with $n \in \mathbb{N}^*$ & $m \in \mathbb{N}^*$ edges. The graph is simple and connected. You start at a specific node, & on each turn you must move through an edge to another node. Answer $q \in \mathbb{N}^*$ queries of the form: “is it possible to start at node a & end up on node b after exactly x turns?”

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of nodes & edges. The nodes are numbered $1, 2, \dots, n$. After this, there are m lines describing the edges. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is an edge between nodes a & b . Finally, there are q lines, each describing a query. Each line contains 3 integers $a, b, x \in \mathbb{N}^*$.

Output. For each query, print the answer (YES or NO) on its own line.

Constraints. $n \in \overline{2, 2500}, m \in [5000], q \in [10^5], x \in \overline{0, 10^9}$.

Sample.

Explanation. In query 1, a possible route is $1 \rightarrow 3 \rightarrow 2$. In query 3, a possible route is $1 \rightarrow 3 \rightarrow 2 \rightarrow 1 \rightarrow 3 \rightarrow 4$. In query 6, a possible route is $3 \rightarrow 4 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 2 \rightarrow 1 \rightarrow 3 \rightarrow 4$.

Problem 255 (CSES Problem Set/transfer speeds sum). A computer network has $n \in \mathbb{N}^*$ computers & $n - 1$ connections between 2 computers. Information can be exchanged between every pair of computers using the connections. Each connection has a certain transfer speed. Let $d(a, b)$ denote transfer speed between computers a & b , which is the speed of the slowest connection on the route between a & b . Compute the sum of transfer speeds between all pairs of computers.

Input. The 1st input line contain an integer $n, m \in \mathbb{N}^*$: the number of computers. The computers are numbered $1, 2, \dots, n$. After this, there are $n - 1$ lines, which describe the connections. Each line has 3 integers $a, b, x \in \mathbb{N}^*$: there is a connection between computers a & b with transfer speed x .

Output. Print 1 integer: the sum of transfer speeds.

Constraints. $n \in [2 \cdot 10^5], x \in [10^6]$.

Problem 257 (CSES Problem Set/MST edge set check). Given an undirected weighted graph & edge sets, determine for each set if the edges can be included in a minimum spanning tree.

Input. The 1st input line has 3 integers $n, m, q \in \mathbb{N}^*$: the number of nodes, edges, & edge sets. The nodes are numbered $1, 2, \dots, n$. The following m lines describe the edges. Each line has 3 integers $a, b, w \in \mathbb{N}^*$: there is an edge between nodes a & b with weight w . The edges are numbered $1, 2, \dots, m$ in the input order. The following $2q$ lines describe the edge sets. For each set, the 1st line contains its size & the 2nd line contains its edges. The total number of edges in all sets is at most m . You can assume that the graph is connected and simple & each edge appears at most once in the graph.

Output. For each edge in the input order, print YES if it can be included in the minimum spanning tree & NO otherwise.

Constraints. $n \in [10^5]$, $m, q \in [2 \cdot 10^5]$, $a, b \in [n]$, $w \in [10^9]$.

Problem 258 (CSES Problem Set/MST edge cost). Given an undirected weighted graph, determine for each edge the minimum spanning tree cost if the edge must be included in the spanning tree.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of nodes & edges. The nodes are numbered $1, 2, \dots, n$. The following m lines describe the edges. Each line has 3 integers $a, b, w \in \mathbb{N}^*$: there is an edge between nodes a & b with weight w . You can assume that the graph is connected and simple & each edge appears at most once in the graph.

Output. For each edge in the input order, print the minimum spanning tree cost when the edge is included.

Constraints. $n \in [10^5]$, $m \in [2 \cdot 10^5]$, $a, b \in [n]$, $w \in [10^9]$

Problem 259 (CSES Problem Set/network breakdown). *Syrjälä's network has $n \in \mathbb{N}^*$ computers & $m \in \mathbb{N}^*$ connections between them. The network consists of components of computers that can send messages to each other. Nobody in Syrjälä understands how the network works. For this reason, if a connection breaks down, nobody will repair it. In this situation a component may be divided into 2 components. Calculate the number of components after each connection breakdown.*

Input. *The 1st input line has 3 integers $n, m, k \in \mathbb{N}^*$: the number of computers, connections, & breakdowns. The computers are numbered $1, 2, \dots, n$. Then, there are m lines describing the connections. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is a connection between computers a & b : Each connection is between 2 different computers, & there is at most 1 connection between 2 computers. Finally, there are k lines describing the breakdowns. Each line has two integers $a, b \in \mathbb{N}^*$: the connection between computers a & b breaks down.*

Output. *After each breakdown, print the number of components.*

Constraints. $n \in [10^5], m \in [2 \cdot 10^5], k \in [m], a, b \in [n]$

Problem 262 (CSES Problem Set/tree isomorphism I). Given 2 rooted trees, find out if they are isomorphic, i.e., it is possible to draw them so that they look the same.

Input. The 1st input line has an integer $t \in \mathbb{N}^*$: the number of tests. Then, there are t tests described as follows: The 1st line has an integer $n \in \mathbb{N}^*$: the number of nodes in both trees. The nodes are numbered $1, 2, \dots, n$, & node 1 is the root. Then, there are $n - 1$ lines describing the edges of the 1st tree, & finally $n - 1$ lines describing the edges of the 2nd tree.

Output. For each test, print YES, if the trees are isomorphic, & NO otherwise.

Constraints. $t \in [10^3]$, $n \in \overline{2, 10^5}$, the sum of all values of n is at most 10^5 .

Problem 264 (CSES Problem Set/flight route requests). There are $n \in \mathbb{N}^*$ cities with airports but no flight connections. You are given $m \in \mathbb{N}^*$ requests which routes should be possible to travel. Determine the minimum number of 1-way flight connections which makes it possible to fulfil all requests.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of cities & requests. The cities are numbered $1, 2, \dots, n$. After this, there are m lines describing the requests. Each line has 2 integers $a, b \in \mathbb{N}^*$: there has to be a route from city a to city b . Each request is unique.

Output. Print 1 integer: the minimum number of flight connections.

Constraints. $n \in [10^5], m \in [2 \cdot 10^5], a, b \in [n]$.

Sample.

Explanation. You can create the connections $1 \rightarrow 2, 2 \rightarrow 3, 2 \rightarrow 4, 3 \rightarrow 1$. Then you can also fly from city 3 to city 4 using the route $3 \rightarrow 1 \rightarrow 2 \rightarrow 4$.

Problem 265 (CSES Problem Set/critical cities). There are $n \in \mathbb{N}^*$ cities & $m \in \mathbb{N}^*$ flight connections between them. A city is called a critical city if it appears on every route from a city to another city. Find all critical cities from Syrjälä to Lehmälä.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of cities & flights. The cities are numbered $1, 2, \dots, n$. City 1 is Syrjälä, & city n is Lehmälä. Then, there are m lines describing the connections. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is a flight from city a to city b . All flights are 1-way. You may assume that there is a route from Syrjälä to Lehmälä.

Output. 1st print an integer k : the number of critical cities. After this, print k integers: the critical cities in increasing order.

Constraints. $n \in [2, 10^5], m \in [2 \cdot 10^5], a, b \in [n]$.

Problem 266 (CSES Problem Set/visting cities). You want to travel from Syrjälä to Lehmälä by plane using a minimum-price route. Which cities will you certainly visit?

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of cities & flights. The cities are numbered $1, 2, \dots, n$. City 1 is Syrjälä, & city n is Lehmälä. Then, there are m lines describing the flights. Each line has 3 integers $a, b, c \in \mathbb{N}^*$: there is a flight from city a to city b with price c . All flights are 1-way. You may assume that there is a route from Syrjälä to Lehmälä.

Output. 1st print an integer k : the number of cities that are certainly in the route. After this, print the k cities sorted in increasing order.

Constraints. $n \in [10^5], m \in [2 \cdot 10^5], a, b \in [n], c \in [10^9]$.

Problem 267 (CSES Problem Set/graph coloring). You are given a simple graph with $n \in \mathbb{N}^*$ nodes & $m \in \mathbb{N}^*$ edges. Use the minimum possible number of colors to color each node such that no edge connects 2 nodes of the same color.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of nodes & edges. The nodes are numbered $1, 2, \dots, n$. Then there are m lines describing the edges. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is an edge connecting nodes a & b .

Output. 1st print an integer k : the minimum number of colors. After this, print n integers c_1, c_2, \dots, c_n : the colors of the nodes. The colors should satisfy $c_i \in [k]$. You may print any valid solution.

Constraints. $n \in [16], m \in [100], m \in 0, \overline{\frac{n(n-1)}{2}}$.

Problem 268 (CSES Problem Set/bus companies). There are $n \in \mathbb{N}^*$ cities & $m \in \mathbb{N}^*$ bus companies. Each bus company operates in specific cities & sells tickets for a specific price. Buying a ticket from a bus company allows you to travel between any 2 cities that the company operates in. Determine the cost of the cheapest route from Syrjälä to every city.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of cities & bus companies. The cities are numbered $1, 2, \dots, n$, & city 1 is Syrjälä. The next line has m integers c_1, c_2, \dots, c_m : the ticket costs for each bus company. After that, there are m pairs of lines describing the cities for each bus company. The 1st line of each pair has a single integer k : the number of cities the bus company operates in. The 2nd line of each pair has k distinct integers a_1, a_2, \dots, a_k : the cities & bus company operates in. You can assume that it is possible to travel from Syrjälä to all other cities.

Output. Print n integers: the cheapest route costs from Syrjälä to cities $1, 2, \dots, n$.

Constraints. $m, n \in [10^5], c \in [10^9], k \in \overline{2, n}, a \in [n]$, the sum of all k is at most $2 \cdot 10^5$.

Problem 269 (CSES Problem Set/split into 2 paths). You are given an acyclic directed graph with $n \in \mathbb{N}^*$ nodes & $m \in \mathbb{N}^*$ edges. Determine whether 2 paths can be formed in the graph s.t. each node of the graph appears in exactly 1 of the paths. Note that all edges of the graph do not need to appear in the paths.

Input. The 1st input line has 2 integers $n, m \in \mathbb{N}^*$: the number of nodes & the number of edges. The nodes are numbered $1, 2, \dots, n$. After this, there are m lines which describe the edges. Each line has 2 integers $a, b \in \mathbb{N}^*$: there is an edge in the graph from node a to node b .

Output. 1st print the line YES if the paths can be formed, or NO otherwise. If the paths can be formed, print them on the following 2 lines. At the beginning of both lines, print the amount of nodes in the path & then the nodes of the path in order. There must be an edge in the graph between subsequent nodes. 1 of the paths may contain zero nodes. If there exist multiple solutions, you can print any solution.

Constraints. $n \in \overline{2, 2 \cdot 10^5}, m \in \overline{0, 5 \cdot 10^5}$.

Counting Problems – Các Bài Toán Đếm

Problem 274 (IMO2008P5). Let $n, k \in \mathbb{N}^*$, $k \geq n$, $k - n : 2$. Let $2n$ lamps labeled $1, 2, \dots, 2n$ be given, each of which can be either on or off. Initially all the lamps are off. We consider sequences of steps: at each step 1 of the lamps is switched (from on to off or from off to on). Let N be the number of such sequences consisting of k steps & resulting in the state where lamps 1 through n are all on, & lamps $n + 1$ through $2n$ are all off. Let M be the number of such sequences consisting of k steps, resulting in the state where lamps 1 through n are all on, & lamps $n + 1$ through $2n$ are all off, but where none of the lamps $n + 1$ through $2n$ is ever switched on. Determine the ratio $\frac{M}{N}$.

Bài toán 47 ([VL24], p. 12, IMO2008P5). Giả sử $n, k \in \mathbb{N}^*$, $k \geq n$, $k - n : 2$. Cho $2n$ bóng đèn được đánh số từ 1 đến $2n$; mỗi bóng có thể sáng hoặc tắt. Tại thời điểm ban đầu mỗi bóng đều tắt. Xét các dãy gồm các bước: tại mỗi bước, công tắc của 1 trong các bóng đèn được bật (từ sáng chuyển thành tắt hoặc từ tắt chuyển thành sáng). Giả sử N là số các dãy mà mỗi dãy gồm k bước & kết thúc ở trạng thái: các bóng đèn từ 1 đến n sáng, các bóng từ $n + 1$ đến $2n$ tắt. Giả sử M là số các dãy mà mỗi dãy gồm k bước & cũng kết thúc ở trạng thái: các bóng đèn từ 1 đến n sáng, các bóng từ $n + 1$ đến $2n$ tắt, nhưng trong quá trình đó không 1 công tắc nào của các bóng từ $n + 1$ đến $2n$ được bật. Tính tỷ số $\frac{M}{N}$.

Input. Chỉ chứa 1 dòng gồm 2 số $n, k \in \mathbb{N}^*$, $k \geq n$, $k - n : 2$ (viết `if else` để kiểm tra điều kiện này).

Output. Tỷ số $\frac{M}{N}$.

25.1 Some combinatorics problems in Mathematical Olympiads – Vài bài toán tổ hợp trong các kỳ thi Olympic Toán

Problem 275 (IMO2009P6). Let a_1, a_2, \dots, a_n be distinct positive integers & let M be a set of $n - 1$ positive integers not containing $s = \sum_{i=1}^n a_i$. A grasshopper is to jump along the real axis, starting at the point 0 & making n jumps to the right with lengths a_1, a_2, \dots, a_n in some order. Prove that the order can be chosen in such a way that the grasshopper never lands on any point in M .

Bài toán 48 ([VL24], 6., p. 14, IMO2009P6). Giả sử a_1, a_2, \dots, a_n là $n \in \mathbb{N}^*$ số nguyên dương khác nhau từng cặp & M là tập hợp gồm $n - 1$ số nguyên dương không chứa số $s = \sum_{i=1}^n a_i$. 1 con châu chấu nhảy dọc theo trục thực, xuất phát từ điểm 0 & tiến hành n bước nhảy về bên phải với độ dài n bước nhảy là a_1, a_2, \dots, a_n theo 1 thứ tự nào đó. Chứng minh con châu chấu có thể chọn thứ tự các bước nhảy sao cho nó không bao giờ nhảy lên bất kỳ điểm nào thuộc M .

Bài toán 49 (CP version of IMO2009P6). Giả sử a_1, a_2, \dots, a_n là $n \in \mathbb{N}^*$ số nguyên dương khác nhau từng cặp & M là tập hợp gồm $n - 1$ số nguyên dương $b_1, b_2, \dots, b_{n-1} \in \mathbb{N}^*$ không chứa số $s = \sum_{i=1}^n a_i$. 1 con châu chấu nhảy dọc theo trục thực, xuất phát từ điểm 0 & tiến hành n bước nhảy về bên phải với độ dài n bước nhảy là a_1, a_2, \dots, a_n theo 1 thứ tự nào đó. Đếm số cách để con châu chấu có thể chọn thứ tự các bước nhảy sao cho nó không bao giờ nhảy lên bất kỳ điểm nào thuộc M & liệt kê cụ thể các bước nhảy của từng cách đó.

Input. Dòng 1 chứa 1 số nguyên dương $n \in \mathbb{N}^*$. Dòng 2 chứa n số nguyên dương khác nhau từng cặp $a_1, a_2, \dots, a_n \in \mathbb{N}^*$. Dòng 3 chứa $n - 1$ số nguyên dương $b_1, b_2, \dots, b_{n-1} \in \mathbb{N}^*$ là $n - 1$ phần tử của tập M (dùng lệnh `if else` để kiểm tra xem số $s = \sum_{i=1}^n a_i$ có thuộc M hay không).

Output. Dòng 1 chứa số cách N nhảy thỏa mãn. N dòng tiếp theo liệt kê cụ thể các bước nhảy của từng cách đó.

Note 2. Hình như bài IMO2009P6 là 1 trong các bài IMO khó nhất về mặt Toán học. Thử xem CP version coi khó tương đương không.

Problem 276 (IMO2010P5). In each of 6 boxes $B_1, B_2, B_3, B_4, B_5, B_6$ there is initially 1 coin. There are 2 types of operation allowed:

1. Type 1: Choose a nonempty box B_i with $i \in [5]$. Remove 1 coin from B_i & add 2 coins to B_{i+1} .
2. Type 2: Choose a nonempty box B_i with $i \in [4]$. Remove 1 coin from B_i & exchange the contents of (possibly empty) boxes B_{i+1} & B_{i+2} .

Determine whether there is a finite sequence of such operations that results in boxes

$$B_1, B_2, B_3, B_4, B_5$$

being empty & box B_6 containing exactly 2010^{2010} coins. (Note that $a^{b^c} = a^{(b^c)}$.)

Bài toán 50 ([VL24], 5., p. 16, IMO2010P5). Mỗi 1 hộp trong 6 hộp B_1, B_2, B_3, B_4, B_5 ban đầu chứa 1 đồng xu. Cho phép tiến hành 2 loại thao tác:

1. Chọn 1 hộp không rỗng B_i với $i \in [5]$. Lấy 1 đồng xu ra khỏi B_i & bỏ thêm 2 đồng xu vào B_{i+1} .
2. Chọn 1 hộp không rỗng B_i với $i \in [4]$. Lấy 1 đồng xu ra khỏi B_i & trao đổi số đồng xu đựng trong các hộp (có thể rỗng) B_{i+1}, B_{i+2} cho nhau.

Tồn tại hay không 1 dãy hữu hạn thao tác như trên sao cho đi đến kết quả cuối cùng là 5 hộp B_1, B_2, B_3, B_4, B_5 đều rỗng, còn hộp B_6 đựng đúng 2010^{2010} đồng xu?

Bài toán 51 (CP version of IMO2010P5). Mỗi 1 hộp trong 6 hộp $B_1, B_2, B_3, B_4, B_5, B_6$ ban đầu chứa 1 đồng xu. Cho phép tiến hành 2 loại thao tác:

1. Chọn 1 hộp không rỗng B_i với $i \in [5]$. Lấy 1 đồng xu ra khỏi B_i & bỏ thêm 2 đồng xu vào B_{i+1} .
2. Chọn 1 hộp không rỗng B_i với $i \in [4]$. Lấy 1 đồng xu ra khỏi B_i & trao đổi số đồng xu đựng trong các hộp (có thể rỗng) B_{i+1}, B_{i+2} cho nhau.

Tồn tại hay không 1 dãy hữu hạn thao tác như trên sao cho đi đến kết quả cuối cùng là trạng thái B_i chứa a_i đồng xu, $\forall i \in [6]$.

Input. 6 số nguyên $a_1, a_2, a_3, a_4, a_5, a_6$.

Output. NO nếu không thể đi đến trạng thái cuối $\{|B_i|\}_{i=1}^6 = \{a_i\}_{i=1}^6$. YES nếu có thể đi đến trạng thái cuối $\{|B_i|\}_{i=1}^6 = \{a_i\}_{i=1}^6$, sau đó in ra 1 dãy hữu hạn thao tác thỏa mãn (bất cứ dãy thao tác thỏa mãn nào cũng được, tính duy nhất không/chưa (?) được đảm bảo ở đây).

Bài toán 52 (Generalized CP version of IMO2010P5). (a) Mỗi 1 hộp trong $n \in \mathbb{N}^*$ hộp B_i ban đầu chứa $a_i \in \mathbb{N}$ đồng xu, $\forall i \in [n]$. Cho phép tiến hành 2 loại thao tác:

1. Chọn 1 hộp không rỗng B_i với $i \in [n-1]$. Lấy 1 đồng xu ra khỏi B_i & bỏ thêm b_i đồng xu vào B_{i+1} .
2. Chọn 1 hộp không rỗng B_i với $i \in [n-2]$. Lấy 1 đồng xu ra khỏi B_i & trao đổi số đồng xu đựng trong các hộp (có thể rỗng) B_{i+1}, B_{i+2} cho nhau.

Tồn tại hay không 1 dãy hữu hạn thao tác như trên sao cho đi đến kết quả cuối cùng là trạng thái B_i chứa c_i đồng xu, $\forall i \in [n]$.

Input. Dòng 1 chứa 1 số nguyên dương $n \in \mathbb{N}^*$. Dòng 2 chứa n số nguyên a_1, a_2, \dots, a_n . Dòng 3 chứa $n-1$ số nguyên dương c_1, c_2, \dots, c_{n-1} .

Output. In ra NO nếu không thể đi đến trạng thái cuối $\{|B_i|\}_{i=1}^n = \{c_i\}_{i=1}^n$. In ra YES nếu có thể đi đến trạng thái cuối $\{|B_i|\}_{i=1}^n = \{c_i\}_{i=1}^n$, sau đó in ra 1 dãy hữu hạn thao tác thỏa mãn (bất cứ dãy thao tác thỏa mãn nào cũng được, tính duy nhất không/chưa (?) được đảm bảo ở đây). (b) Có thể mở rộng từ 2 thao tác đã mô tả cho vài thao tác khác phức tạp hơn được không?

Problem 277 (IMO2011P4). Let $n \in \mathbb{N}^*$. We are given a balance & n weights of weight $2^0, 2^1, \dots, 2^{n-1}$. We are to place each of the n weights on the balance, 1 after another, in such a way that the right pan is never heavier than the left pan. At each step we choose 1 of the weights that has not yet been placed on the balance, & place it on either the left pan or the right pan, until all of the weights have been placed. Determine the number of ways in which this can be done.

Bài toán 53 ([VL24], 5., p. 16, IMO2010P5). Cho $n \in \mathbb{N}^*$. Cho 1 cái cân 2 đĩa & n quả cân với trọng lượng là $2^0, 2^1, \dots, 2^{n-1}$. Ta muốn đặt lên cái cân mỗi 1 trong n quả cân, lần lượt từng quả 1, theo cách để đảm bảo đĩa cân bên phải không bao giờ nặng hơn đĩa cân bên trái. Ở mỗi bước ta chọn 1 trong các quả cân chưa được đặt lên cân, rồi đặt nó hoặc vào đĩa bên trái, hoặc vào đĩa bên phải, cho đến khi tất cả các quả cân đều đã được đặt trên cân. Đếm số cách để thực hiện được mục tiêu.

Problem 278 (IMO2012P3). The liar's guessing game is a game played between 2 players A, B . The rules of the game depend on 2 positive integers $k, n \in \mathbb{N}^*$ which are known to both players. At the start of the game A chooses integers x, N with $x \in [N]$. Player A keeps x secret, & truthfully tells N to player B . Player B now tries to obtain information about x by asking player A questions as follows: each question consists of B specifying an arbitrary set S of positive integers (possibly one specified in some previous question), & asking A whether x belongs to S . Player B may ask as many such questions as he wishes. After each question, player A must immediately answer with yes or no, but is allowed to lie as many times as she wants; the only restriction is that, among any $k+1$ consecutive answers, at least 1 answer must be truthful. After B has asked as many questions as he wants, he must specify a set X of at most n positive integers. If $x \in X$, then B wins; otherwise, he loses. Prove: (a) If $n \geq 2^k$, then B can guarantee a win. (b) For all sufficiently large k , there exists an integer $n \geq 1.99^k$ s.t. B cannot guarantee a win.

Bài toán 54 ([VL24], IMO2012P3). Trò chơi nói dối & đoán là 1 trò chơi giữa 2 người chơi A & B. Luật chơi dựa trên số số nguyên dương $k, n \in \mathbb{N}^*$ mà cả 2 người chơi đều được biết trước. Khi bắt đầu trò chơi, A chọn các số nguyên x, N với $x \in [N]$. Người chơi A giữ bí mật số x , & thông báo số $N - 1$ cách trung thực cho người chơi B. Bây giờ B tìm cách nhận thông tin về số x bằng cách hỏi người chơi A các câu hỏi: B xác định 1 tập hợp S các số nguyên dương tùy ý & hỏi A liệu x có thuộc S . Người chơi B có thể hỏi bao nhiêu câu hỏi cũng được, & cũng có thể hỏi lại 1 câu hỏi nhiều lần, vào bất cứ lúc nào mà anh ta muốn. Người chơi A phải trả lời mỗi câu hỏi của B ngay lập tức bằng đúng hoặc sai, nhưng anh ta được phép nói dối nhiều lần 1 cách tùy ý. Sự hạn chế duy nhất ở đây là trong bất kỳ $k + 1$ câu trả lời liên tiếp nào cũng phải có ít nhất 1 câu trả lời thật. Sau khi B đã đặt nhiều câu hỏi như anh ta muốn, anh ta phải xác định 1 tập hợp X có không quá n số nguyên dương. Nếu $x \in X$ thì B thắng cuộc; còn nếu ngược lại, anh ta thua cuộc. Chứng minh: (a) Nếu $n \geq 2^k$, thì B có thể đảm bảo thắng cuộc. (b) Với tất cả số k đủ lớn, tồn tại $n \geq 1.99^k$ sao cho B không thể thắng cuộc.

Remark 8. For this kind of lie-&-guess game, watch, e.g., *Tomodachi Game* (2022).

25.2 Knapsack problem – Bài toán xếp balô

Resources – Tài nguyên.

1. [Wikipedia/knapsack problem](#).
2. [Wikipedia/list of knapsack problem](#).

The *knapsack problem* is the following problem in combinatorial optimization:

Problem 279. Given a set of items, each with a weight & a value, determine which items to include in the collection so that the total weight is less than or equal to a given limit & the total value is as large as possible.

– Cho 1 tập hợp các mục, mỗi mục có 1 trọng số & 1 giá trị, hãy xác định những mục nào sẽ đưa vào bộ sưu tập sao cho tổng trọng số nhỏ hơn hoặc bằng 1 giới hạn nhất định & tổng giá trị lớn nhất có thể.

It derives its name from the problem faced by someone who is constrained by a fixed-size knapsack & must fill it with the most valuable items. The problem often arises in **resource allocation** where the decision-makers have to choose from a set of non-divisible projects or tasks under a fixed budget or time constraint, resp.

– Nó có tên bắt nguồn từ vấn đề mà một người phải đối mặt khi bị hạn chế bởi một chiếc ba lô có kích thước cố định & phải lấp đầy nó bằng những vật phẩm có giá trị nhất. Vấn đề thường phát sinh trong việc phân bổ nguồn lực, khi những người ra quyết định phải lựa chọn từ một tập hợp các dự án hoặc nhiệm vụ không thể chia nhỏ theo một ngân sách cố định hoặc hạn chế thời gian, tương ứng.

The knapsack problem has been studied for more than a century, with early works dating as far back as 1897.

– Bài toán ba lô đã được nghiên cứu trong hơn một thế kỷ, với những tác phẩm đầu tiên có niên đại từ năm 1897.

The **subset sum problem** is a special case of the decision & 0-1 problems where each kind of item, the weight equals the value $w_i = v_i$. In the field of cryptography, the term *knapsack problem* is often used to refer specifically to the subset sum problem. The subset sum problem is 1 of **Karp's 21 NP-complete problems**.

– Bài toán tổng tập con là một trường hợp đặc biệt của bài toán quyết định & 0-1 trong đó mỗi loại mục, trọng số bằng giá trị $w_i = v_i$. Trong lĩnh vực mật mã, thuật ngữ *knapsack problem* thường được sử dụng để chỉ cụ thể bài toán tổng tập con. Bài toán tổng tập con là 1 trong 21 bài toán NP-complete của Karp.

25.2.1 Applications of knapsack problem – Ứng dụng của bài toán xếp balô

Knapsack problems appear in real-world decision-making processes in a wide variety of fields, e.g. finding the least wasteful way to cut raw materials, selection of investments & portfolios, selection of assets for **asset-backed securitization**, & generating keys for the **Merkle–Hellman** & other **knapsack cryptosystems**.

– Các vấn đề về ba lô xuất hiện trong các quá trình ra quyết định thực tế ở nhiều lĩnh vực khác nhau, ví dụ như tìm cách ít lãng phí nhất để cắt giảm nguyên liệu thô, lựa chọn khoản đầu tư & danh mục đầu tư, lựa chọn tài sản để chứng khoán hóa bằng tài sản, & tạo khóa cho Merkle–Hellman & các hệ thống mật mã ba lô khác.

1 early application of knapsack algorithms was in the construction & scoring of tests in which the test-takers have a choice as to which questions they answer. For small examples, it is a fairly simple process to provide the test-takers with such a choice. E.g., if an exam contains 12 questions each worth 10 points, the test-taker need only answer 10 questions to achieve a maximum possible score of 100 points. However, on tests with a heterogeneous distribution of point values, it is more difficult to provide choices. **Feurman & Weiss** proposed a system in which students are given a heterogeneous test with a total of 125 possible points. The students are asked to answer all of the questions to the best of their abilities. Of the possible subsets of problems whose total point values add up to 100, a knapsack algorithm would determine which subset gives each student the highest possible score.

– 1 ứng dụng ban đầu của thuật toán ba lô là trong việc xây dựng & chấm điểm các bài kiểm tra trong đó người làm bài kiểm tra có thể lựa chọn câu hỏi mà họ trả lời. Đối với các ví dụ nhỏ, đây là một quá trình khá đơn giản để cung cấp cho người làm bài kiểm tra sự lựa chọn như vậy. Ví dụ, nếu một bài kiểm tra có 12 câu hỏi, mỗi câu có giá trị 10 điểm, người làm bài kiểm tra chỉ cần trả lời 10 câu hỏi để đạt được số điểm tối đa có thể là 100 điểm. Tuy nhiên, đối với các bài kiểm tra có sự phân bố điểm không đồng nhất, việc cung cấp các lựa chọn sẽ khó khăn hơn. Feuerman & Weiss đã đề xuất một hệ thống trong đó học sinh được đưa ra một bài kiểm tra không đồng nhất với tổng số 125 điểm có thể. Học sinh được yêu cầu trả lời tất cả các câu hỏi theo khả năng tốt nhất của mình. Trong số các tập hợp con có thể có của các bài toán có tổng giá trị điểm bằng 100, thuật toán ba lô sẽ xác định tập hợp con nào mang lại cho mỗi học sinh điểm cao nhất có thể.

A 1999 study of the Stony Brook University Algorithm Repository showed that, out of 75 algorithmic problems related to the field of combinatorial algorithms & algorithm engineering, the knapsack problem was the 19th most popular & the 3rd most needed after **suffix trees** & the **bin packing problem**.

25.2.2 Definition of knapsack problem – Định nghĩa bài toán xếp balô

The most common problem being solved is the 0-1 knapsack problem, which restricts the number x_i of copies of each kind of item to 0 or 1. Given a set of n items numbered from 1 up to n , each with a weight w_i & a value v_i , along with a maximum weight capacity W ,

$$\text{maximize } \sum_{i=1}^n v_i x_i \text{ subject to } \sum_{i=1}^n w_i x_i \leq W, \quad x_i \in \{0, 1\}, \forall i \in [n].$$

Here x_i represents the number of instances of item i to include in the knapsack. Informally, the problem is to maximize the sum of the values of the items in the knapsack so that the sum of the weights is \leq the knapsack's capacity.

– Bài toán phổ biến nhất đang được giải quyết là bài toán ba lô 0-1, bài toán này hạn chế số lượng x_i bản sao của mỗi loại vật phẩm là 0 hoặc 1. Cho một tập hợp n vật phẩm được đánh số từ 1 đến n , mỗi vật phẩm có trọng lượng w_i & giá trị v_i , cùng với sức chứa trọng lượng tối đa W ,

$$\text{maximize } \sum_{i=1}^n v_i x_i \text{ theo } \sum_{i=1}^n w_i x_i \leq W, \quad x_i \in \{0, 1\}, \forall i \in [n].$$

Tại đây x_i biểu thị số lượng các trường hợp của vật phẩm i cần đưa vào ba lô. Nói một cách không chính thức, bài toán là phải tối đa hóa tổng giá trị của các vật phẩm trong ba lô sao cho tổng trọng lượng bằng \leq sức chứa của ba lô.

The *bounded knapsack problem* (BKP) removes the restriction that there is only 1 of each item, but restricts the number x_i of copies of each kind of item to a maximum nonnegative integer value c :

$$\text{maximize } \sum_{i=1}^n v_i x_i \text{ theo } \sum_{i=1}^n w_i x_i \leq W, \quad x_i \in \overline{0, c}, \forall i \in [n].$$

– Bài toán ba lô bị giới hạn (BKP) loại bỏ hạn chế là chỉ có 1 cho mỗi mục, nhưng hạn chế số lượng x_i bản sao của mỗi loại mục thành giá trị số nguyên không âm tối đa c :

$$\text{maximize } \sum_{i=1}^n v_i x_i \text{ theo } \sum_{i=1}^n w_i x_i \leq W, \quad x_i \in \overline{0, c}, \forall i \in [n].$$

The *unbounded knapsack problem* (UKP) places no upper bound on the number of copies of each kind of item & can be formulated as above except that the only restriction on x_i is that it is a nonnegative integer.

$$\text{maximize } \sum_{i=1}^n v_i x_i \text{ theo } \sum_{i=1}^n w_i x_i \leq W, \quad x_i \in \mathbb{N}, \forall i \in [n].$$

– Bài toán ba lô không giới hạn (UKP) không đặt giới hạn trên cho số lượng bản sao của mỗi loại vật phẩm & có thể được xây dựng như trên ngoại trừ hạn chế duy nhất đối với x_i là nó là một số nguyên không âm.

$$\text{maximize } \sum_{i=1}^n v_i x_i \text{ theo } \sum_{i=1}^n w_i x_i \leq W, \quad x_i \in \mathbb{N}, \forall i \in [n].$$

Bài toán 55 ([Thà13], p. 25, xếp balô, MAX-KNAPSACK). Cho 1 lô hàng hóa gồm các gói hàng, mỗi gói đều có khối lượng cùng với giá trị cụ thể, & cho 1 chiếc balô. Chọn từ lô này vài gói hàng nào đó & xếp đầy vào balô, nhưng không được quá, sao cho thu được 1 GTLN có thể.

Đây là 1 bài toán tối ưu tổ hợp quen thuộc, được ký hiệu là MAX-KNAPSACK & được phát biểu bằng ngôn ngữ Toán học dưới dạng tổng quát:

- Input. Cho 2 dãy số nguyên dương $\{s_i\}_{i=1}^N \cup \{S\} = s_1, \dots, s_n, S \in \mathbb{N}^*$ & $\{\nu_i\}_{i=1}^n = \nu_1, \dots, \nu_n$.
- Task. Tìm 1 tập con $I \subset [n]$ thỏa

$$\sum_{i \in I} s_i \leq S, \sum_{i \in I} \nu_i \rightarrow \max.$$

- Formulation of an optimization problem.

$$\max_{I \subset [n]} \sum_{i \in I} \nu_i \text{ subject to } \sum_{i \in I} s_i \leq S.$$
